STUDY ON
"DO-IT-YOURSELF (HOMEMADE) LATRINES"

1.0 BACKGROUND

In Bangladesh, approximately 200,000 children under five years of age die of diarrhoeal diseases every year. The causes of diarrhoeal diseases are predominantly due to the limited use of tubewell water for all domestic needs, poor environmental sanitation and personal hygiene practices.

A recent survey by Mitra & Associates in 1991 indicated that the overall sanitation coverage was 26%; 60% with homemade latrines and 40% with water-seal latrines. The incidence of water and sanitation related diseases particularly diarrhoea has remained the major killer of children under 5 years. With the increased coverage of water supply, it was anticipated that there would be a related drop in these diseases. However, unfortunately this drop has not materialized. Increased attention was therefore paid to integrating water supply, sanitation and hygiene education - Integrated Approach (IA), to combat these diseases more effectively.

Since 1987 the homemade (Do-It-Yourself) pit latrines were promoted through the IA programme, for families who could not afford to buy the water seal latrines. It was recognized that the promotion of the homemade pit latrine programme can only be considered as the initial improvement to the existing practice of open defecation. In order to assess the status of the homemade latrine programme, in terms of its technology and user's reaction, it was proposed that a study be undertaken. WHO Community Water Supply & Sanitation Project BAN CWS 001 team was requested to carry out such a study (Annex I).

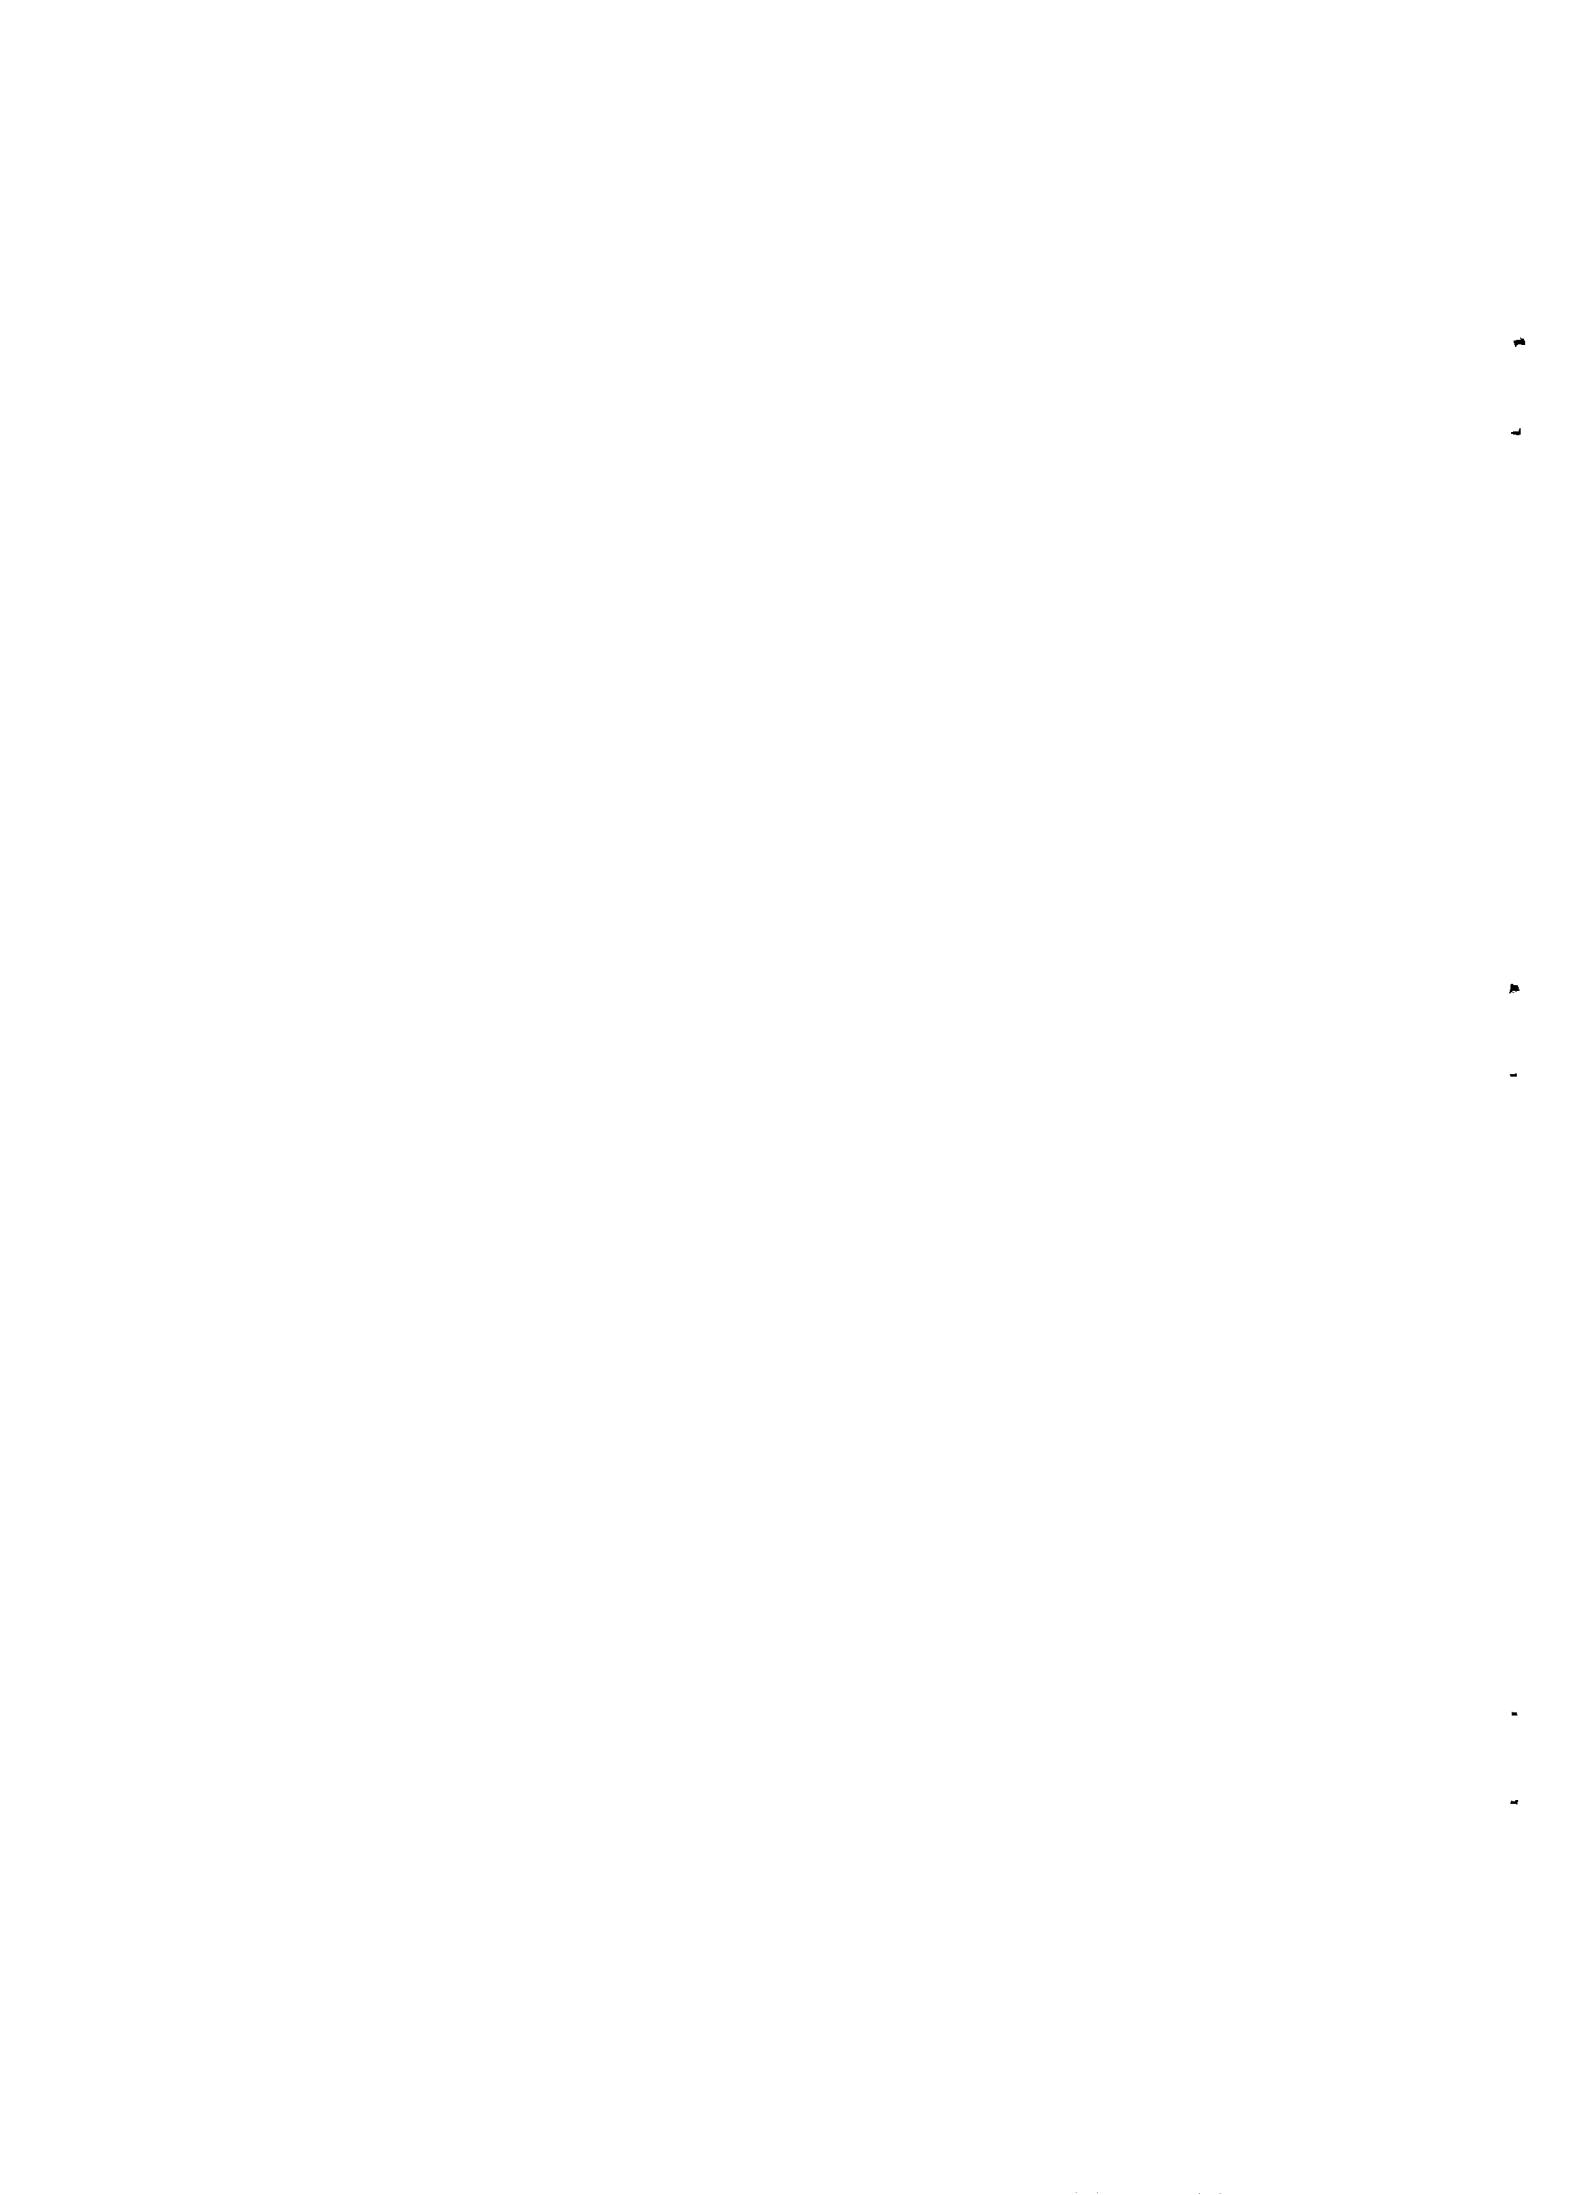

2.0 OBJECTIVES OF STUDY

- (a) To assess the appropriateness, acceptability and affordability of homemade latrines.
- (b) To determine whether homemade latrines are properly constructed, used and maintained.
- (c) To obtain construction details on the different types of homemade latrines, for the purpose of updating low cost latrine manuals.
- (d) To determine what messages, on homemade latrines and hygiene practices were disseminated to the villagers, and how.

3.0 STUDY DESIGN:

The field study was designed, inter-alia to collect the following information:

- Type and dimensions of the homemade latrines.
- Soil conditions.
- The type of materials used for pit lining, squatting platform, pit cover, and superstructure.
- Cost of materials and labour.
- Users' attitudes towards pit latrines.
- Source from where information on construction methods was acquired.
- Life expectancy of latrine pits.
- Economic status of the families, usage level-categorywise (male, female, children) and number of users.
- Steps taken when the pit was filled up.
- Any effects due to weather conditions.
- Sources of messages on latrine usage.

4.0 METHODOLOGY

Sample Areas

A total of 35 sample districts, (an average of) five districts from each of the seven DPHE Circles, were randomly selected. To have a well balanced country-wide distribution of samples, 2 districts out of the 3 districts from Chittagong Hill Tracts Circle were selected and 6 districts in each the larger Circles namely Dhaka, Barisal and Chittagong were chosen. In the remaining two Circles, 5 districts in each were selected.

Within the 35 sample districts, 35 sample Thanas, one from each district, were randomly selected. Similarly the sample Unions (one from each Thana) were also randomly selected. The list of the 35 sample Unions is given in Annex II.

Sample Latrines

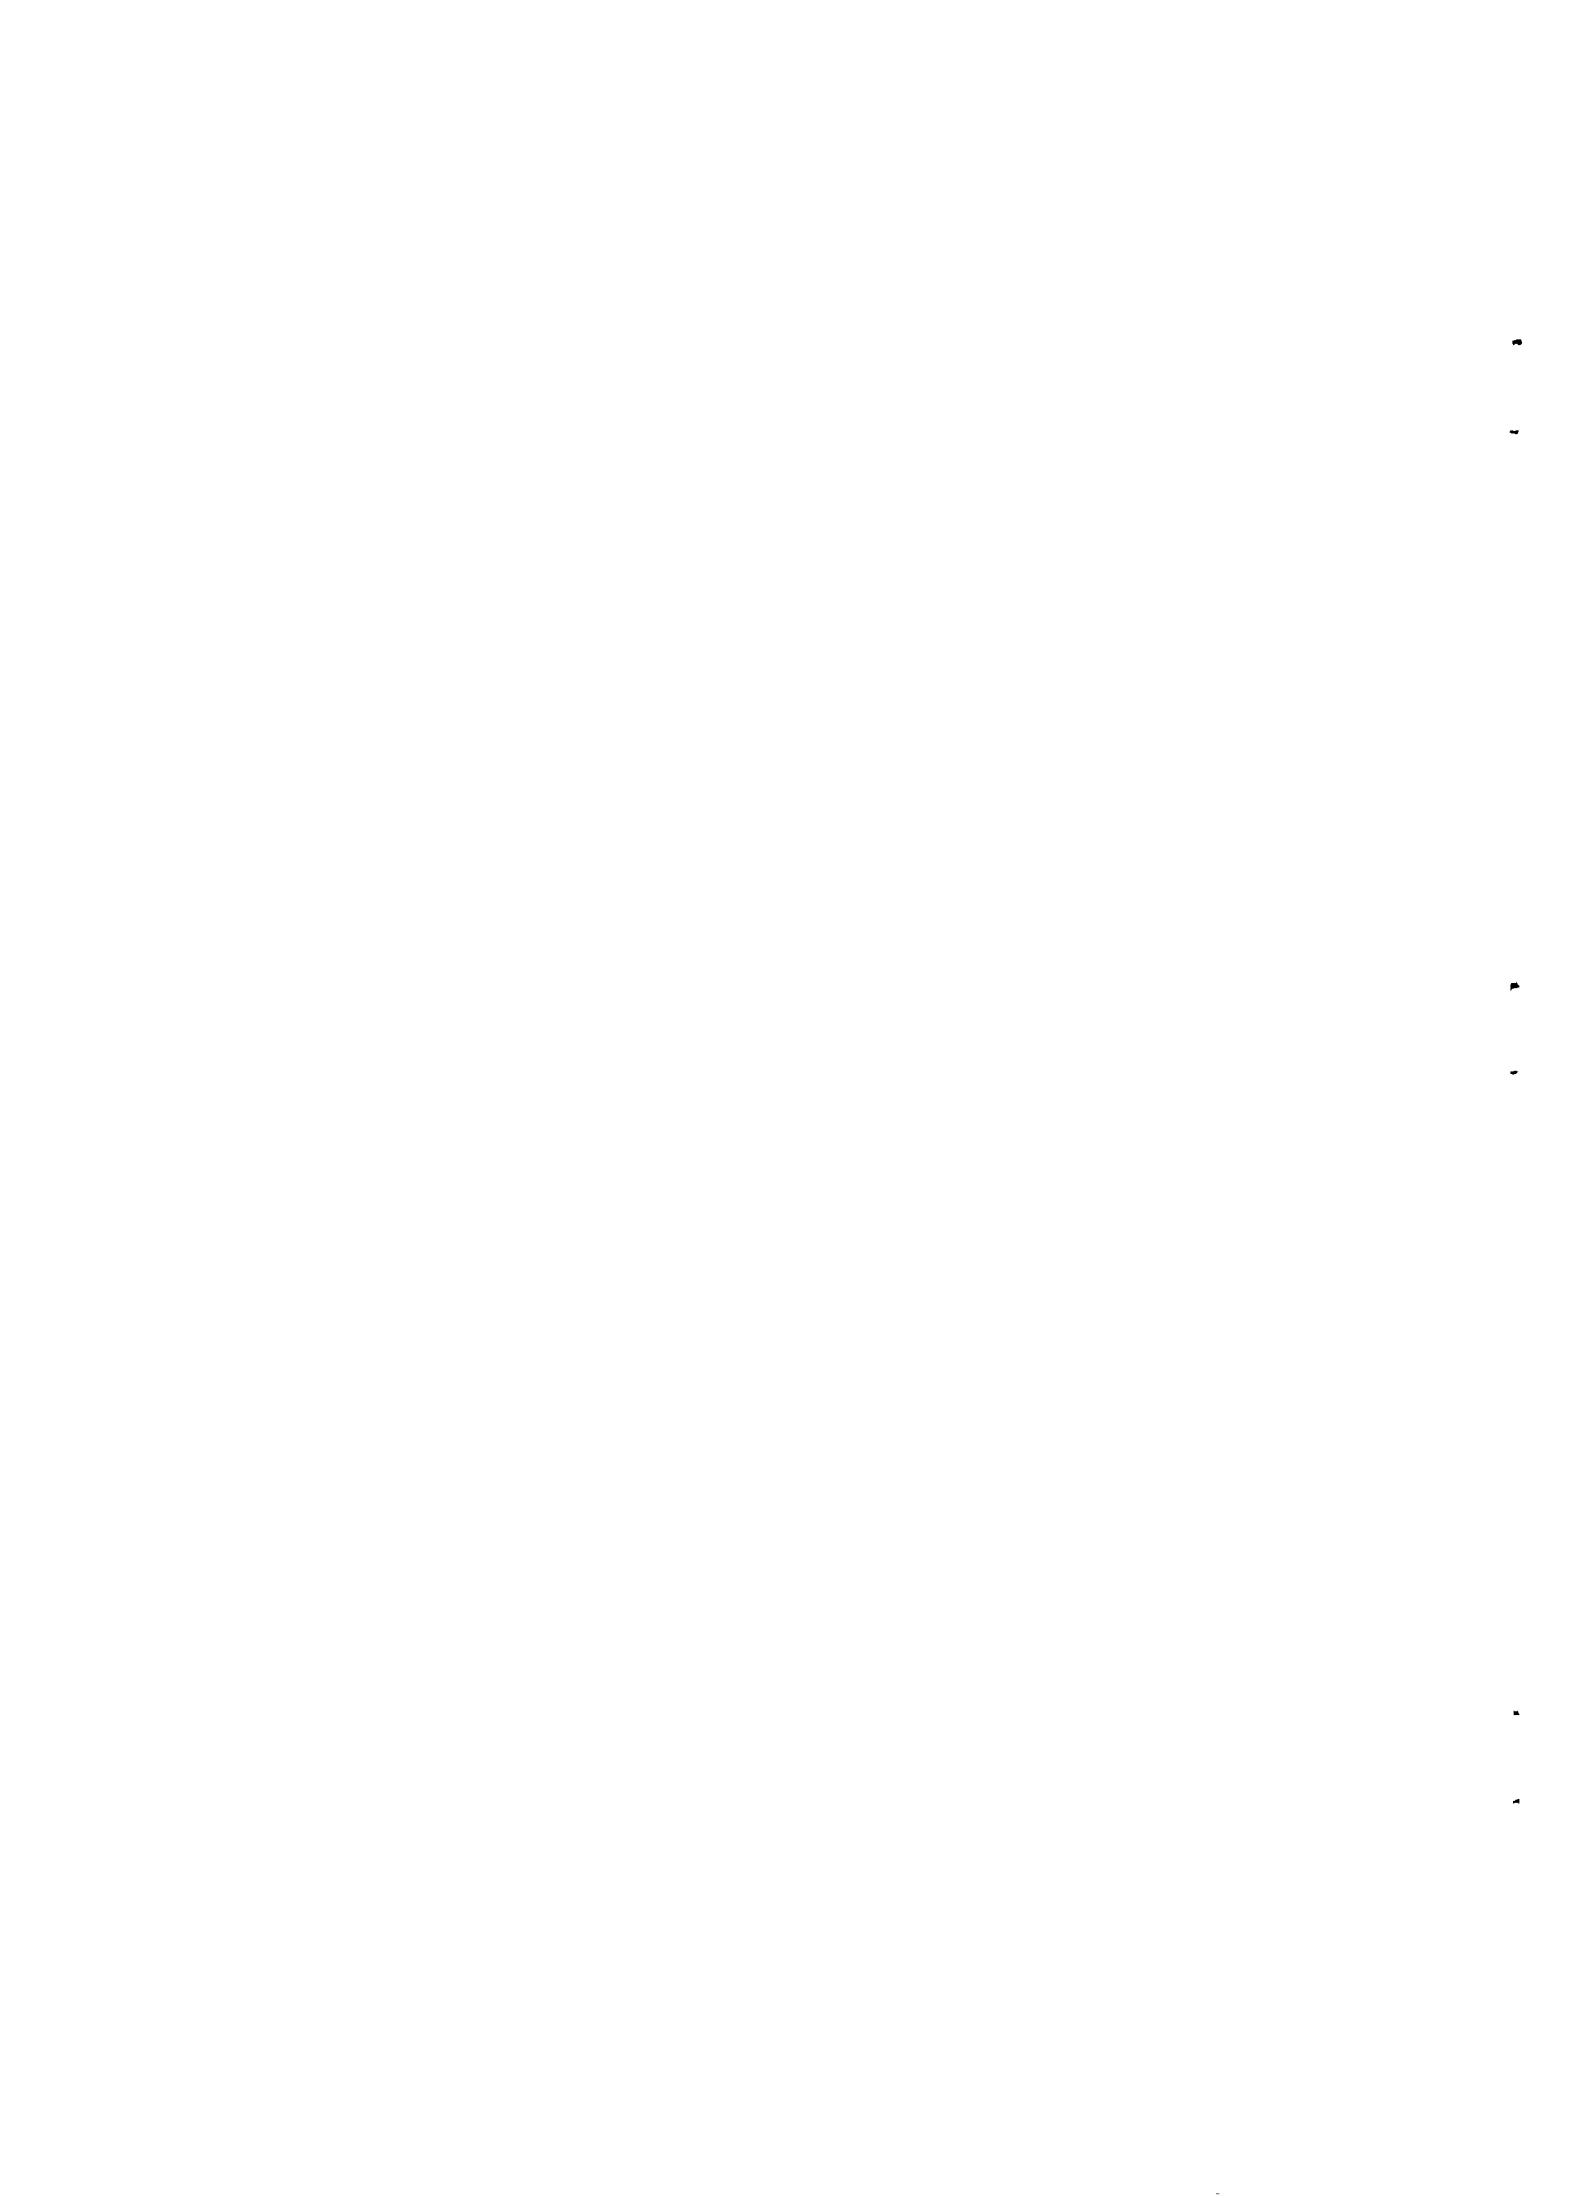

It was planned that in each Union 10 randomly selected latrines in at least 3 villages would be surveyed. The total sample size thus proposed was 350 latrines. The latrines should be at least 2 kms away from the nearest thana HQ.

Study period

May - June 1993

Survey tools

The survey tools were drafted by the WHO BAN CWS 001 Team and finalized after a review with UNICEF and DPHE (Annex III).

Data Collection The National Field Programme Officer (NFPO) BAN CWS 001 briefed the Field Sanitation Officers (FSOs) regarding approaches for information gathering and the recording of data on survey questionnaires. The FSOs visited the latrine sites as instructed and gathered the necessary information.

Reporting The information gathered from the field was processed and analyzed at the BAN CWS 001 project office. A draft report prepared by the WHO Team was reviewed by DPHE and UNICEF and finalized jointly.

5. FINDINGS

(a) Status of beneficiaries of homemade latrines

- Table I shows that 11% of the heads of the households having latrines were service holders; 17% were self employed; 58% were farmers and 14% were labourers. The total number of females, males and children below 10 years in the 238 families surveyed were 595, 680 and 517 respectively.
- Of the heads of the households 17% are illiterate, 33% had received primary education, 36% secondary and 14% above secondary education.
- In terms of income levels, it was indicated that 40% of the households with latrines had yearly savings over Tk. 2000.

- In terms of the status of land occupancy it is noted that 97% of the house-holds surveyed had their houses on the plot of land covering more than 3 decimals.
- This would indicate that sufficient land was available to construct another home-made latrine if required.

(b) Latrine Technology:

General - Location from Thana Headquarters

- It is seen from Table V-1 that 30% of the latrines were located 2- 5 kms from thana headquarters while 70% of the latrines were located further away.

Superstructure

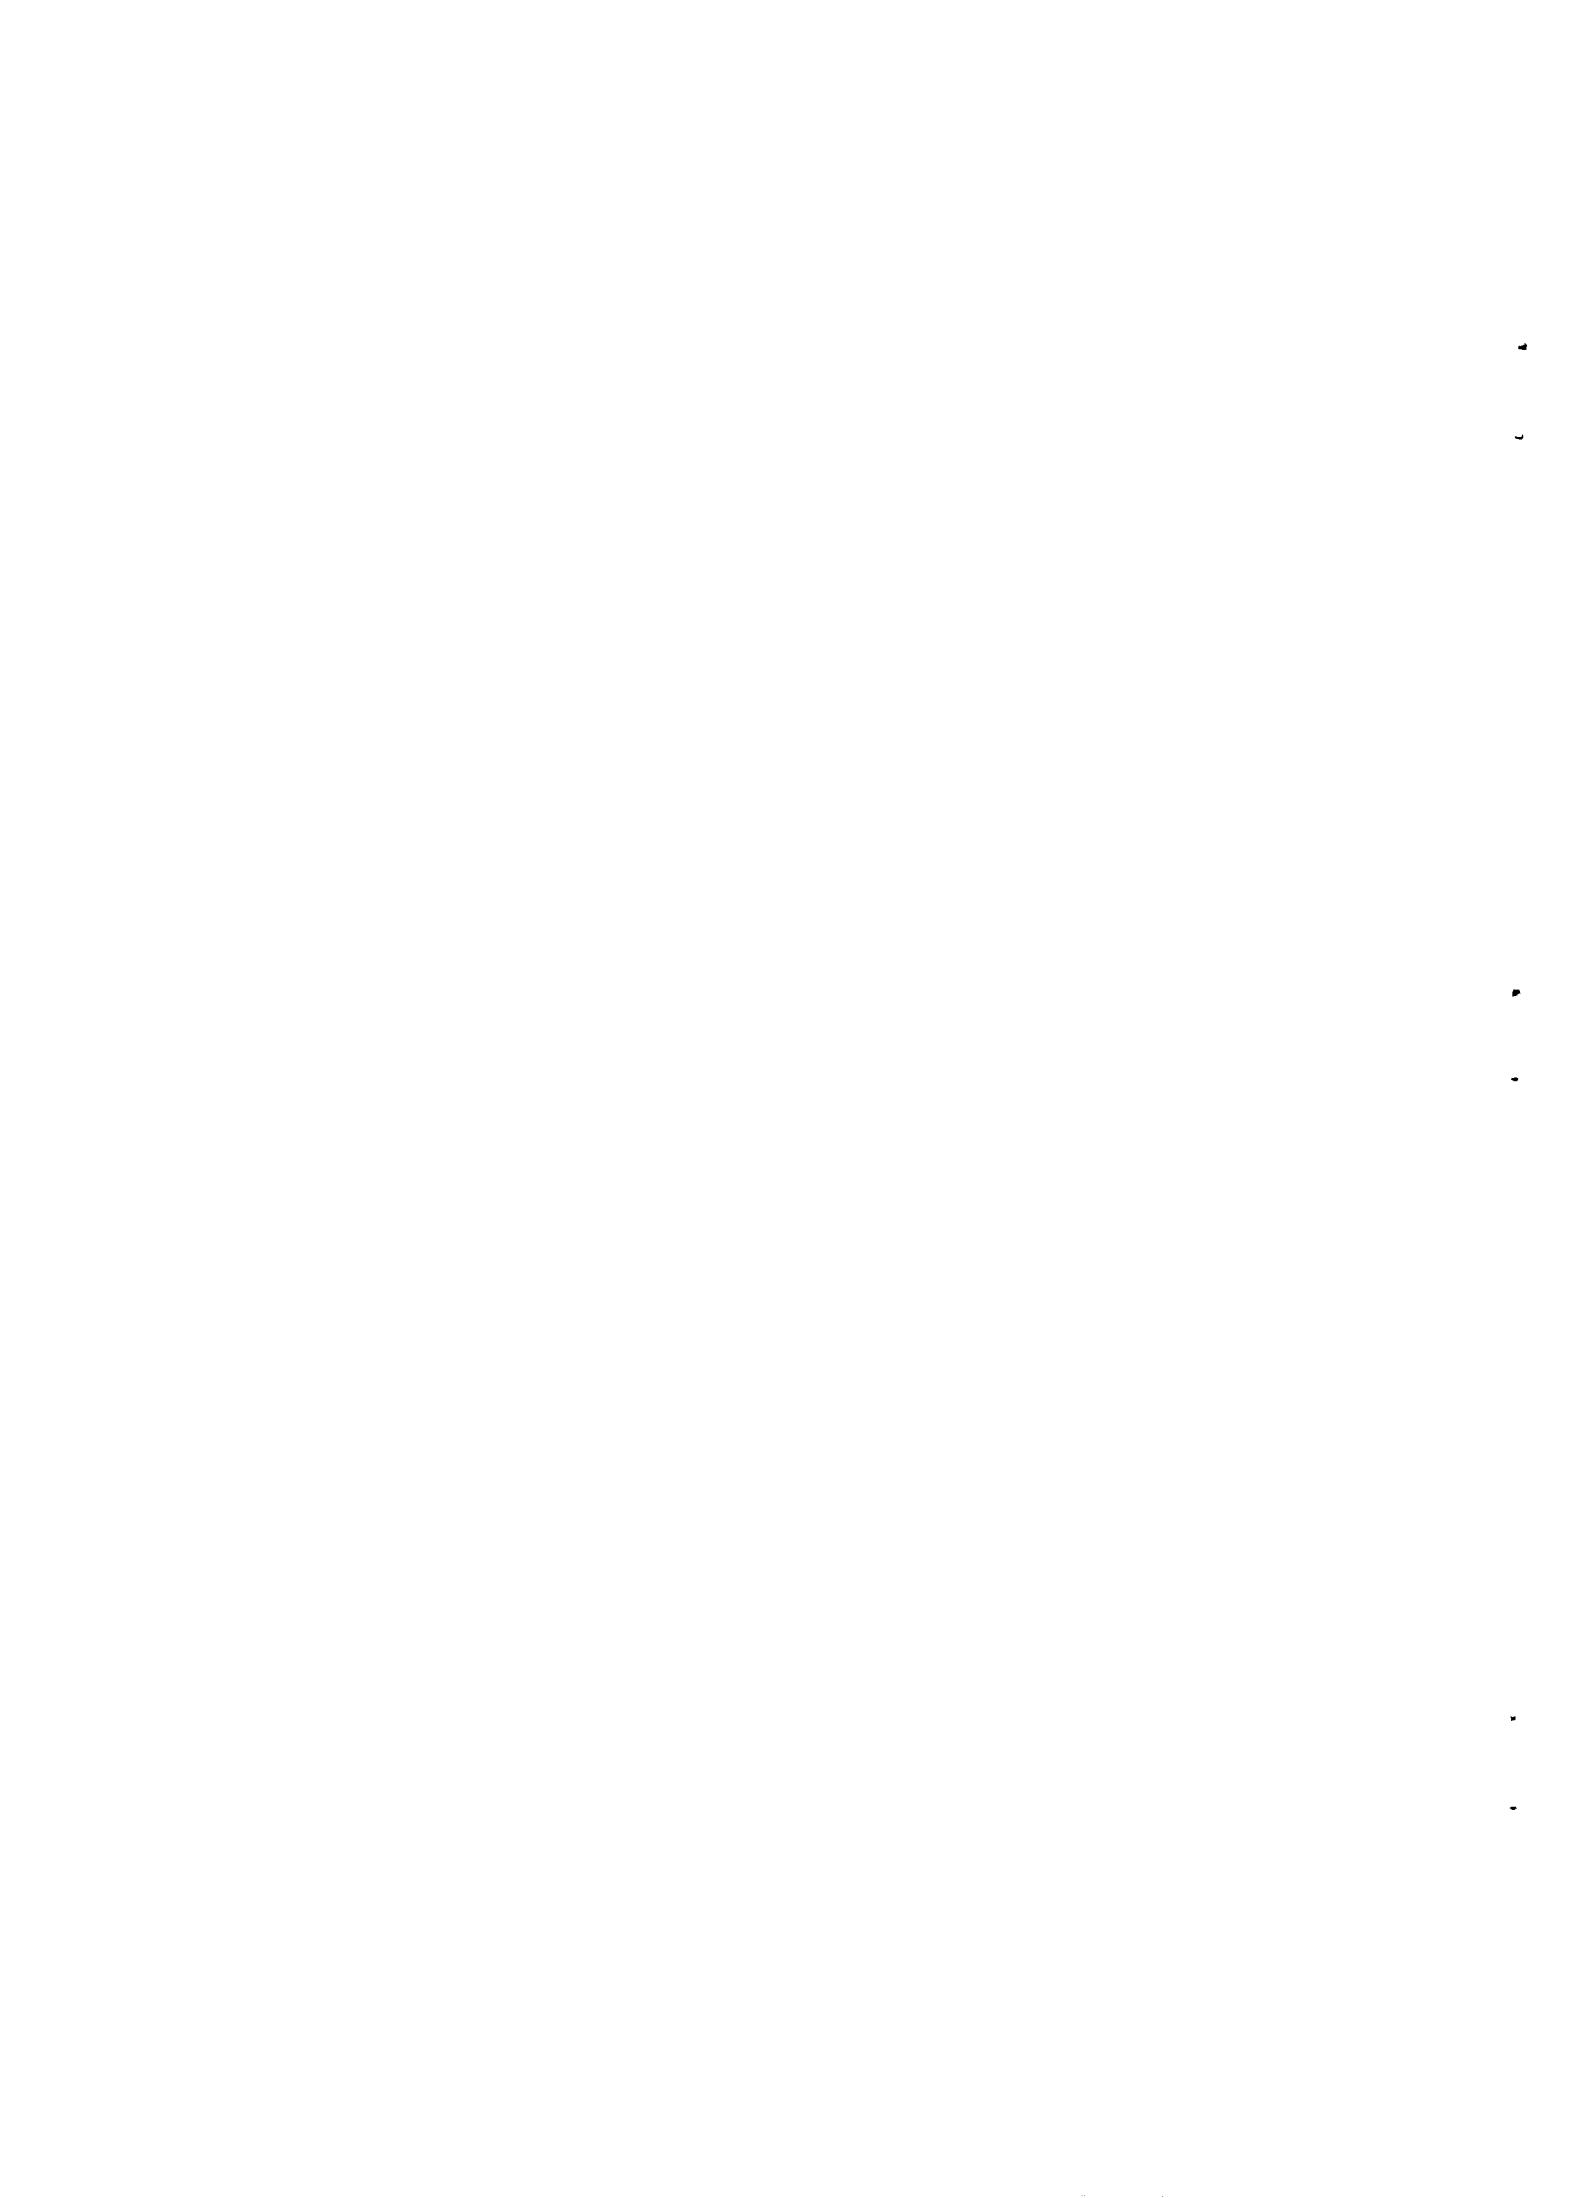

- Table II shows that 67% of the households surveyed had constructed their latrines larger than 4 ft.X4 ft. and 33% smaller.
- Some 83% of the superstructures were erected on bamboo poles and 8% on wooden poles.

Roof

- Some 79% of the home-made latrines did not have any roof and 21% had a roof.
- Out of 50 roofs, 31 were of straw, 11 of leaves of banana, hugla, palm, betelnut or coconut tree and 8 of iron sheet or tarja.

Fencing Wall

- For the construction of fencing walls, 51% of the house-holds used straw and leaves, 20% used tarza/bamboo, 17% used jute stick and 11% used metal sheet etc. Only 2 (1%) of the latrines (located in the bush) had no fence at all.

Door

- The table indicates that 55% of the latrines were provided with a curtain of jute mat, 13% with a curtain of straw/leaves and 13% fenced with jute sticks/Tarja and some 19% latrines were found without any such curtain or door.

Durability of materials

- Of the 41 latrines fenced with jute sticks, 3 had been in use for more than 12 months (without repair).
- Some 122 of the latrines had walls built with leaves/straw; 15 had been in use for more than 12 months (without repair).
- Of the 82 latrines fenced with GI sheets and Tarja, 7 had been in use for more than 12 months (without repair).

(c) Platform (Direct Pit)

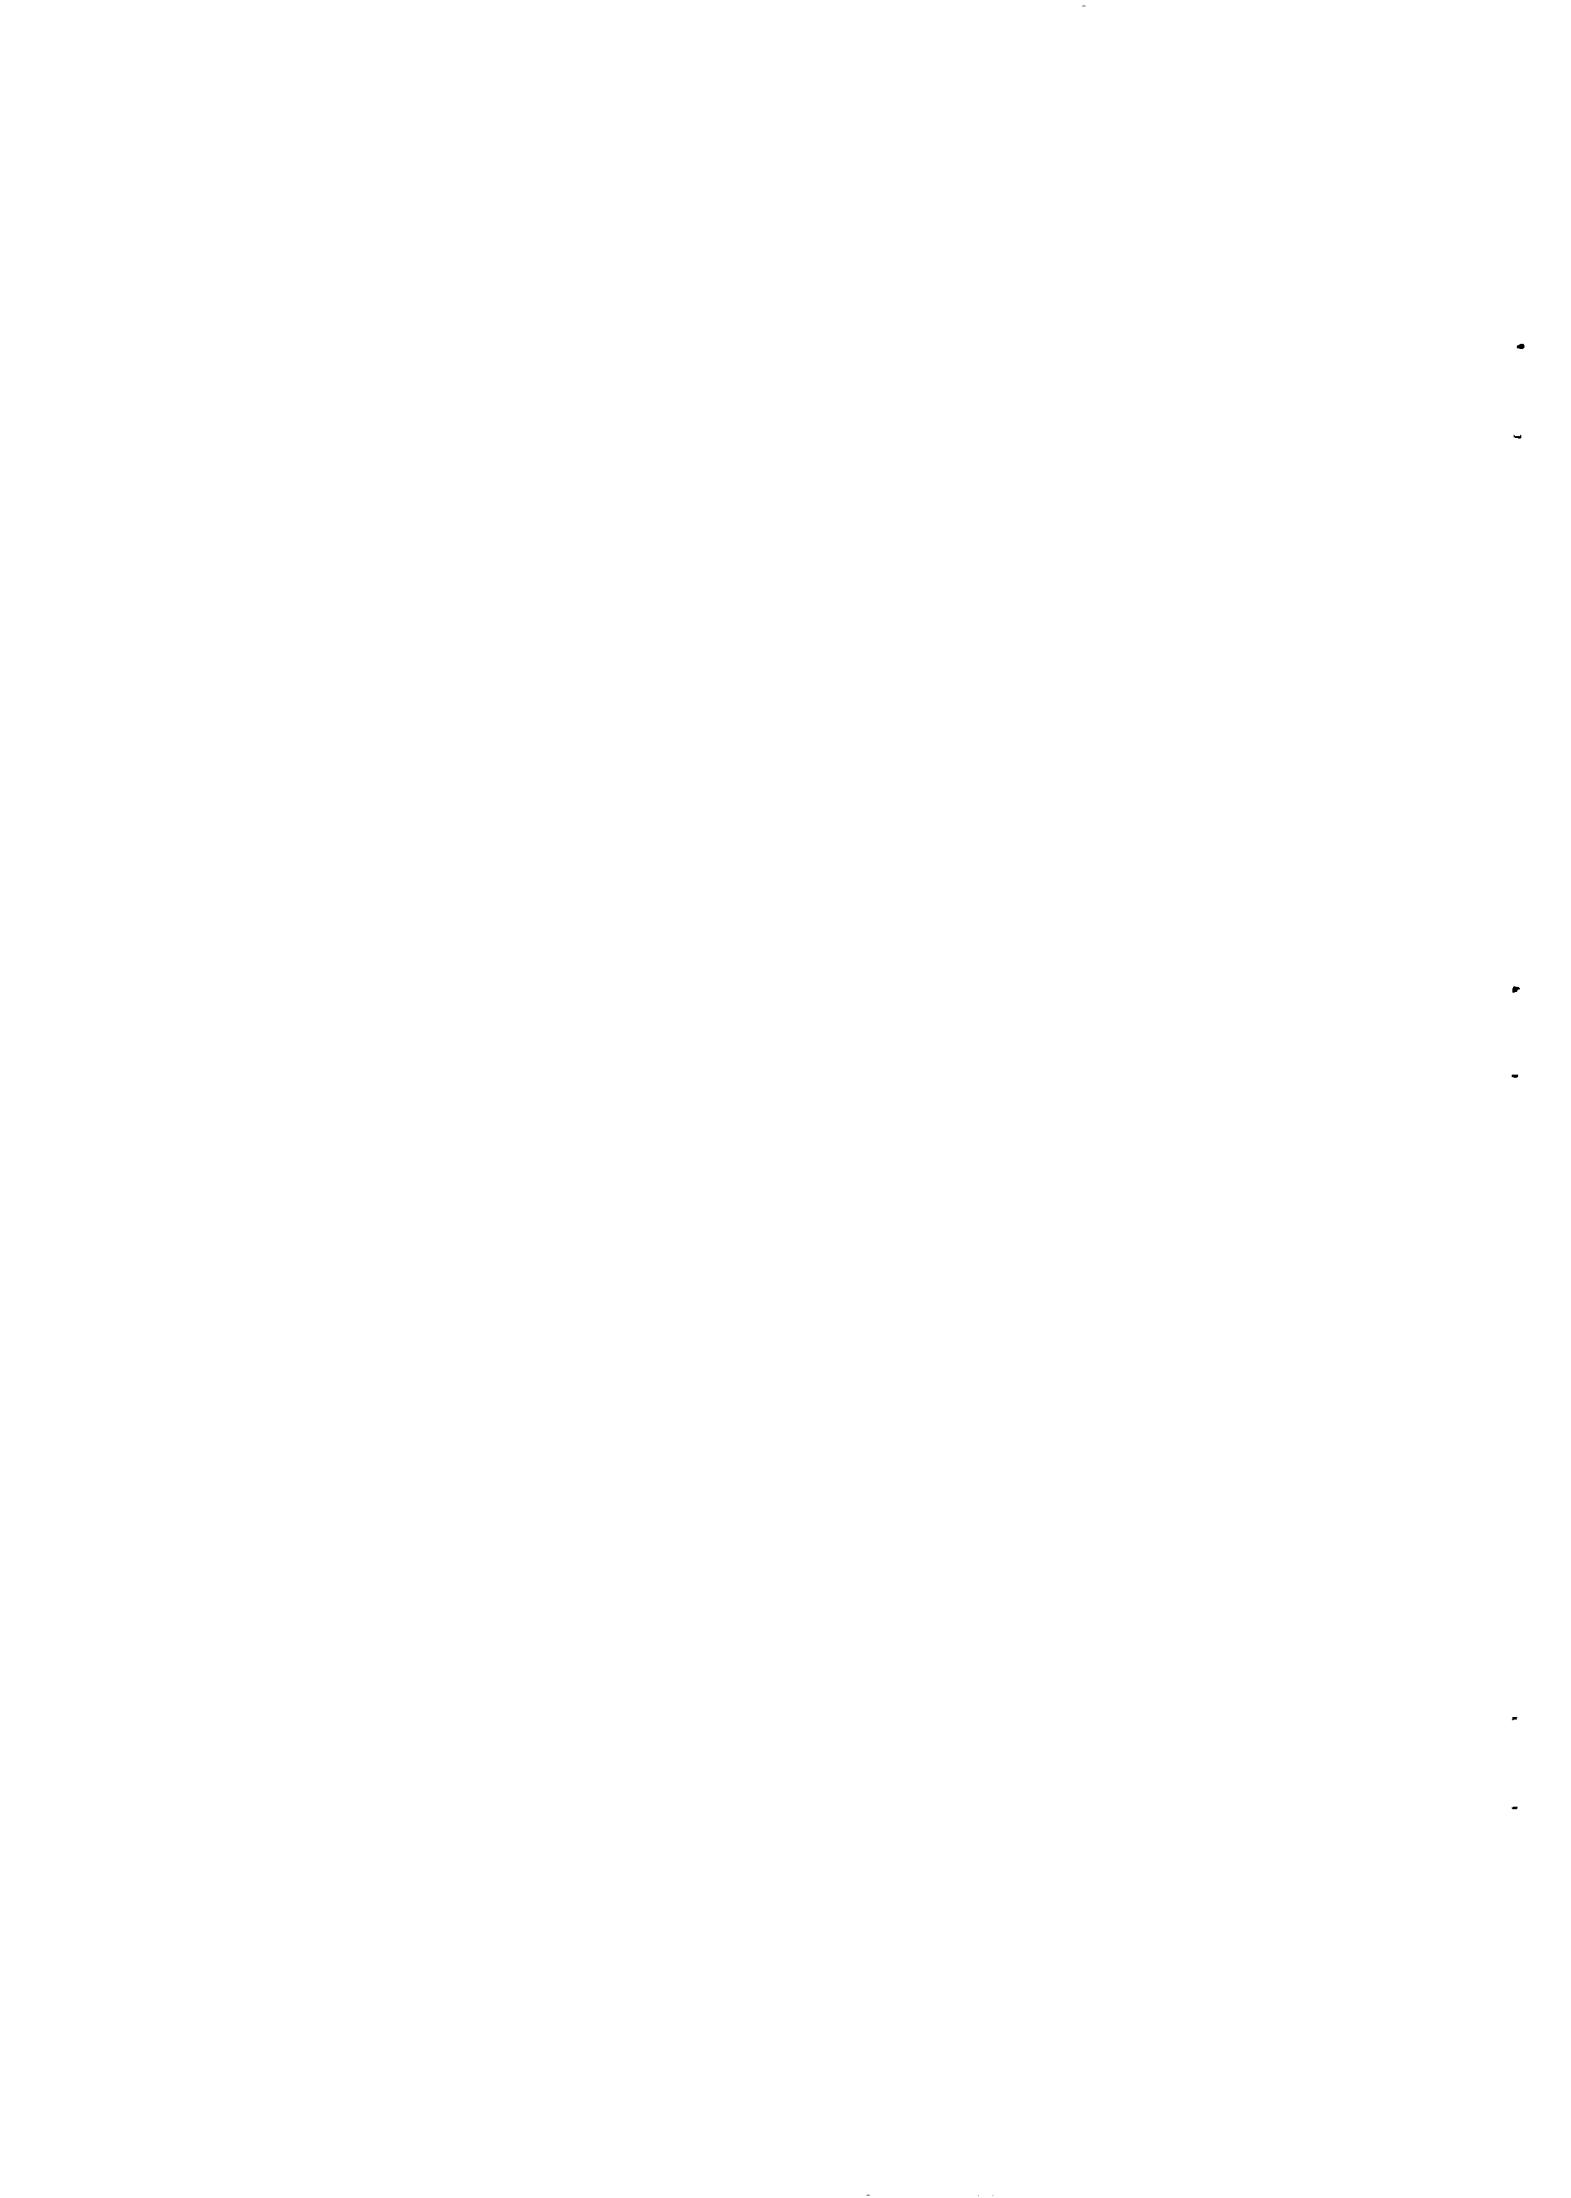

- In 8% of the latrines surveyed, only 2 pieces of bamboo/wooden logs were being used in place of a platform.

Height of platform above ground level

- Table III shows that in 58% of the latrines surveyed the floor was raised about 6 inches above the ground level and for the remaining 42%, the floor was raised more than 6 inches.

Size

- It was shown that 47% of the latrines were constructed with platforms of sizes larger than 4 ft.X4 ft. and 45% smaller.

Materials

- The table shows that 55% of the platforms were made of bamboo, 31% of wood and 6% of other materials. The rest, about 8% of the latrines were supported by 2 wooden/bamboo logs; this could not be classified as a platform.

Size of squatting hole

- The table reveals that the length of the squatting hole, for 43% of the latrines surveyed, was less than 12 inches, for 31% 12-18 inches and for 26% greater than 18 inches.
- The width of squatting holes in 23% of the latrines was up to 6 inches, in 47% latrines 6 - 8 inches and in 30% of the latrines greater than 8 inches.
- Only 7% of the latrines had squatting hole covers. Most of these were located in Barisal Circle.

(d) Platform (Offset pit)

- Table IV shows that of the 15 offset pit latrines, 33% of the platforms were made with brick or concrete, 33% with earth and 34% with other materials like bamboo, coconut leaves etc.
- The chutes were made of plastic in 2 cases, iron sheet in 11 cases and palm/coconut leaves in 2 cases. The length of the chutes was upto 2 ft. in 12 cases.

(e) Latrine pit:

- Of the 238 latrines 223 (94%) were found to be direct pit type and only 15 (6%) were offset pit type latrines.

Distance from drain and water source

- The table reveals that 27% of the latrines surveyed were installed within 30 ft. from drains/tube wells/water sources whereas 73% of the latrines were installed beyond 30 ft.

Diameter of pit

- The table shows that the diameter of the pits for 73% of the latrines was 2.5 - 3 ft., for 17% less than 2.5 ft. and for 10% more than 3 ft..

Shape of pit

- Table V-2 shows that the shape of 50% of the pits was cylindrical, 42% conical and 8.0% oval.

Depth of pits

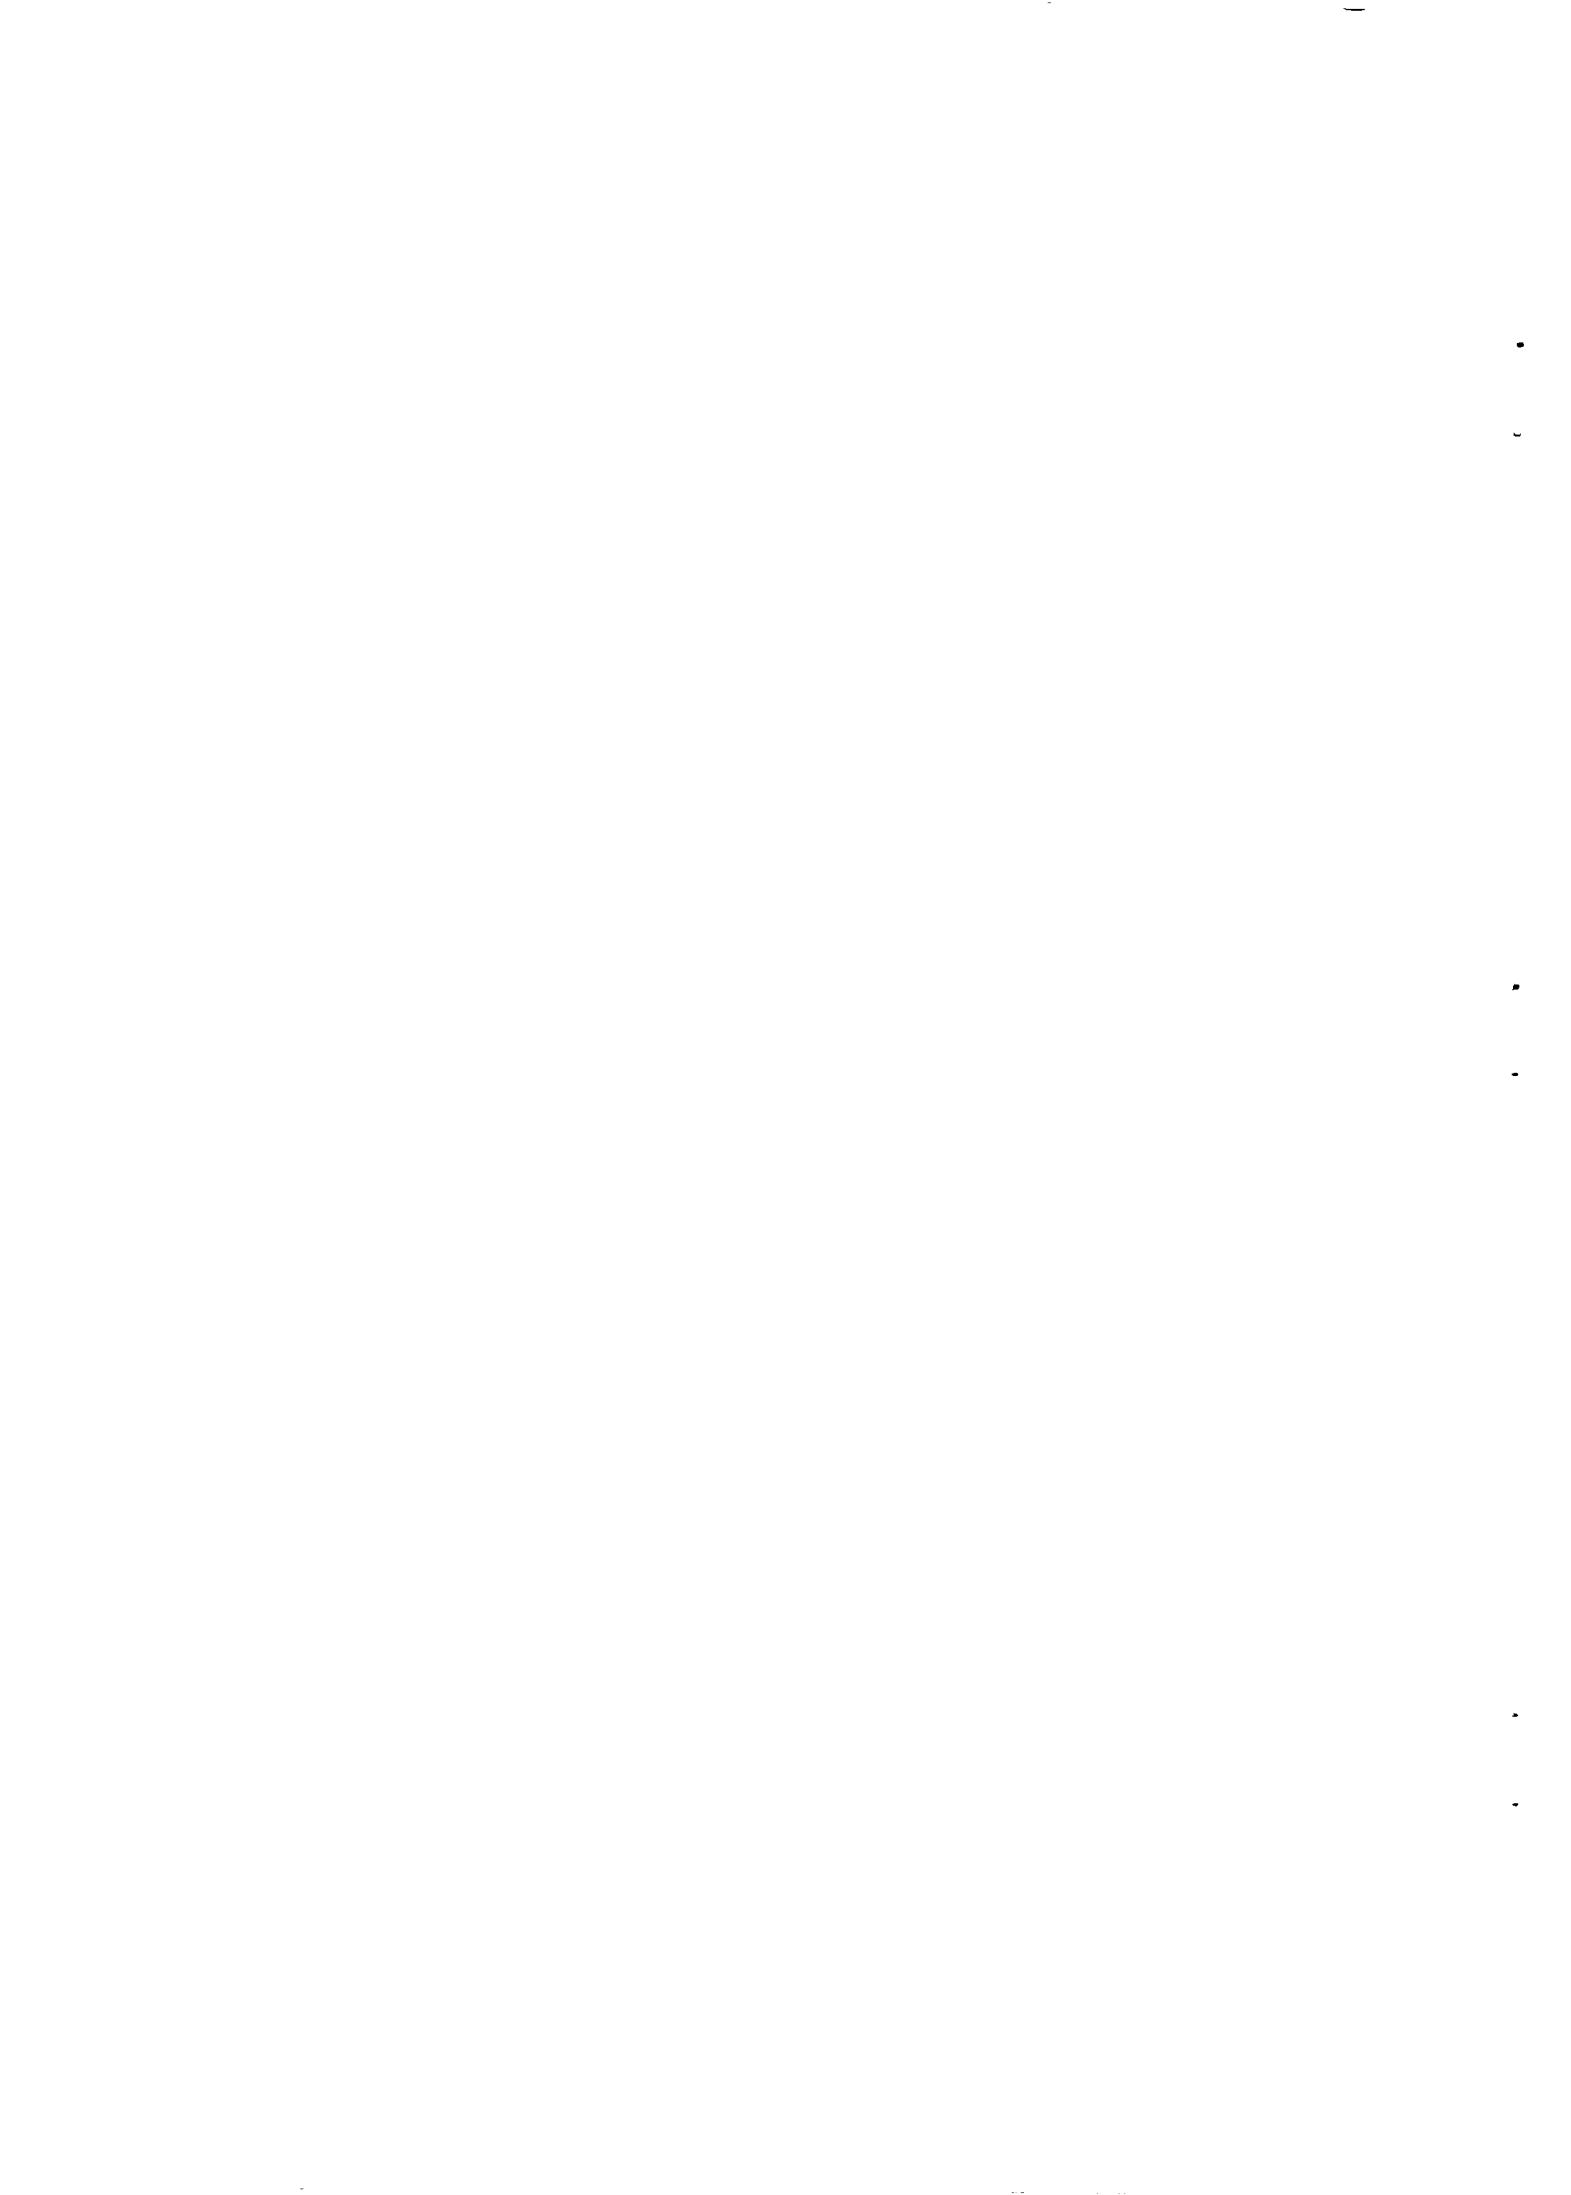

- The depth of pits for 22% of the latrines was less than 5 ft. for 65% of the latrines 5 ft. to 7 ft. and for 13% greater than 7 ft.
- Of the 101 latrines constructed in clayey soils, 57 (57%) of the pits had depths of 6 ft. or more and 44 (43%) less than 6 ft.
- Of the 86 latrines constructed in silty soils 30 (35%) had depths of 6 ft. or more and 56 (65%) less than 6 ft.
- Of the 51 latrines constructed in sandy soil 13 (25%) had depth of 6 ft. or more and 38 (75%) less than 6 ft.

Depth of water table

- Depth of water table for 21% of the latrine locations was less than 3 ft. in the rainy season.

Lining of pit

- Some 97% of the pits were not lined. Where used the lining materials were bamboo and tree branches.

(f) Cost for Latrine (Offset Pit)Cost for lining

- Table VI-1 shows that the unit costs of lining of pits was nil, indicating that the pits were not lined.

Cost for materials of pit cover

- The table shows that the unit costs for materials for 27% of the pit covers was more than Tk. 30 and for 73% the cost was less than Tk. 30.

Cost for materials of platform

- The unit costs for platform materials for 60% of the latrines were upto Tk. 20 and for 40% more than Tk. 20.

Cost for chute

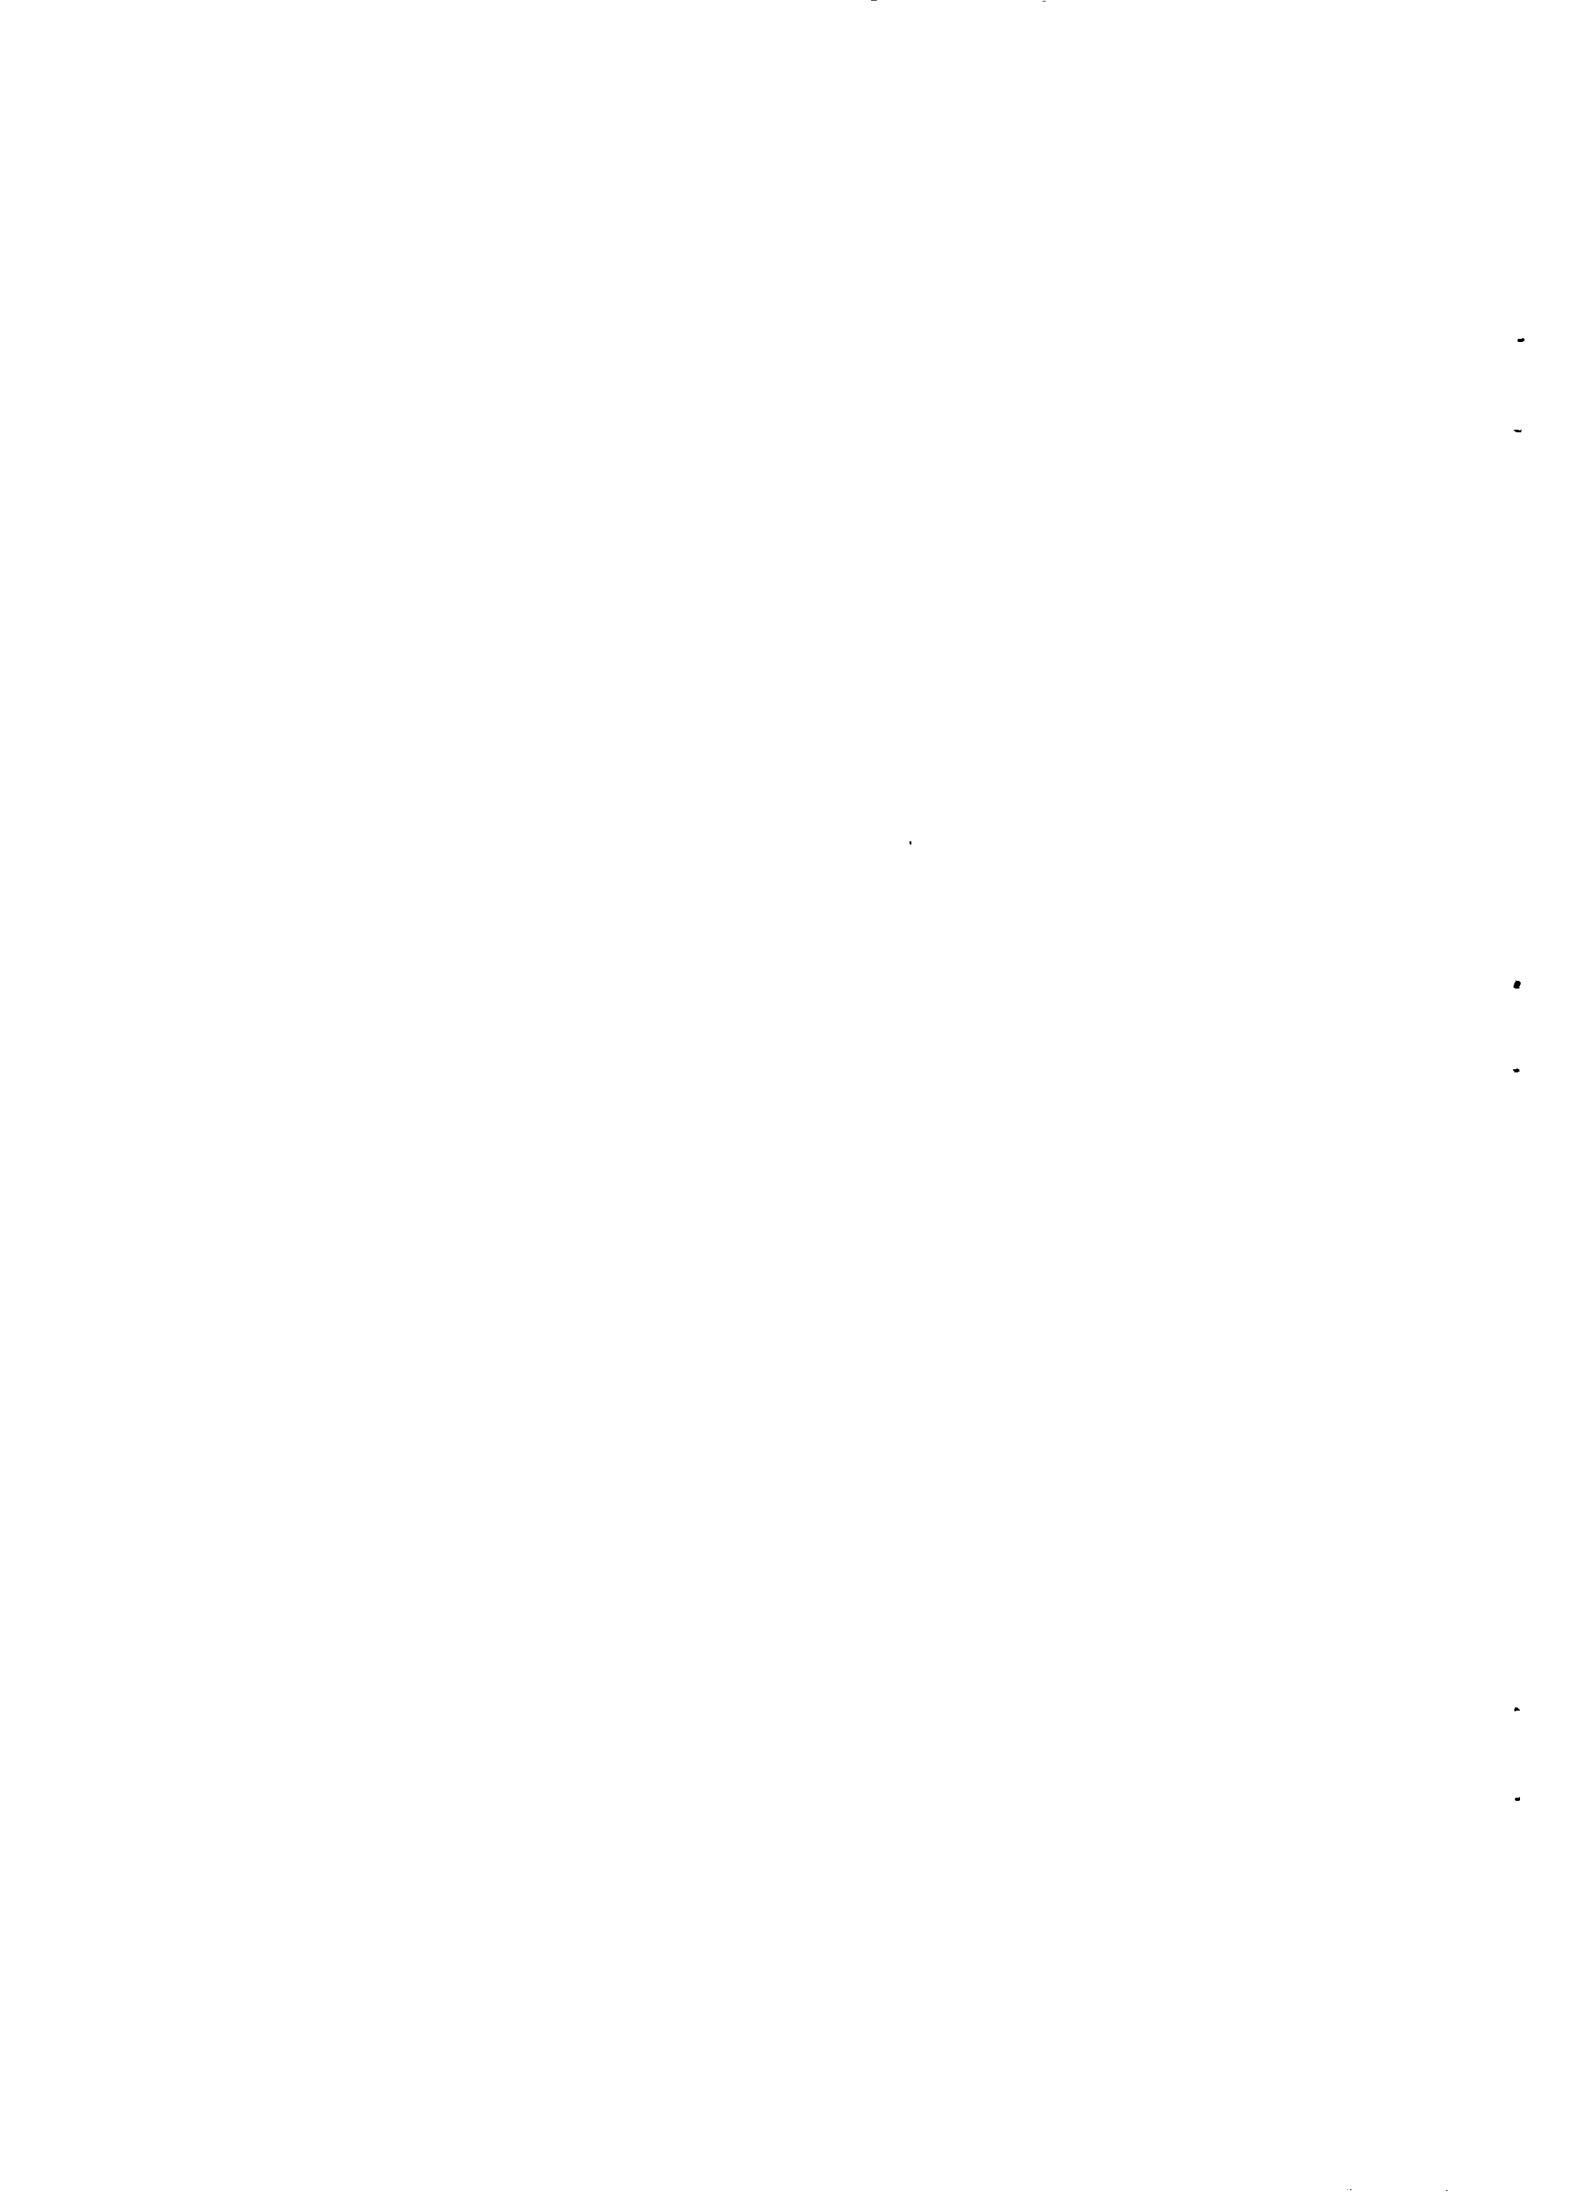

- The unit costs for 53% of the chutes was more than Tk. 15. The cost for 47% of the chutes was Tk. 15 or less.

Cost for materials of super structure

- Unit material costs for the super structure for 47% of the latrines were more than Tk. 40 and for 53% Tk. 40 or less.

Labour cost

- The unit labour costs for the construction of the sub-structure for 33% of the latrines were more than Tk. 25 and for 67% Tk. 25 or less.
- Labour costs for the super-structure for 47% of the latrines were more than Tk. 15 and for 53% less than Tk. 15

Total cost

- Total unit costs for the construction of 47% & of the offset pit latrines were more than Tk. 125 and for 53% less than Tk. 125.

(g) Cost of latrines (Direct pit)Cost for pit lining materials

- Table VI-2 shows that the unit costs for pit lining materials in 4 out of 7 cases were more than Tk. 30 and for the remaining 3 latrines Tk. 30 or less.

Cost for platform materials

- Unit costs for platform materials for 44% of the latrines were more than Tk. 45 and for 56% Tk. 45 or less.

Cost for materials of superstructure

- The unit costs of materials for 62% of the superstructures were Tk. 40 or less and for 38% more than Tk. 40.

Labour cost

- The unit labour costs for 30% of the substructures were more than Tk. 30 and for 70 % less than Tk. 30.
- The unit labour costs for 67% of the super-structure was Tk.15 or less and for 33% more than Tk.15.

Total cost

- The total unit cost for 50% of the direct pit latrines was Tk. 110 or less and for 50% more than Tk. 110.

(h) Development of Latrine Usage

- Table VII indicates that before the construction of the present latrines, 62% of the families claimed to have developed the habit of using latrines for more than 2 years, 11% of families for less than 2 years and 27% of families had no practice of using latrines.
- Some 33% of the families (238) surveyed had either insanitary disposal systems or defecated in the open.

Pit contents

- The table shows that of the 159 families who had latrines before, 88% of the families covered the content of the filled-up pits with earth and 12% of the users kept the pit contents open posing hazards to public health.

Use of sludge

- Only about 2% of the users utilized the stabilized sludge as fertilizer for plants.

Reasons for latrine Usage

- The table also shows that the reasons for the use of latrines was primarily privacy for 54% of the families, health for 31% of the families and convenience for 15% of the families surveyed.

(i) Latrine Promotion

General

- The table indicates that 6% of the families had been exposed to hygiene messages delivered by DPHE officials, 2% delivered by health workers, 13% delivered by NGOs, 13% delivered by Ansar/VDP, 44% delivered by family members and 22% delivered by relatives, neighbors and schools.

- Only 54% of the families knew about the one ring-one slab latrines available from the DPHE Village Sanitation Centres.

Information about latrine construction

- Table VIII shows that only 6% of the families surveyed had received information on the construction of latrines from DPHE staff, 1% from health workers, 4% from NGOs, 13% from Ansar/VDP, 71% from family members and 5% from relatives, neighbors and schools.
- The table also shows that the average life of 16% of the pits was more than 2 years.

Type of latrine preferred

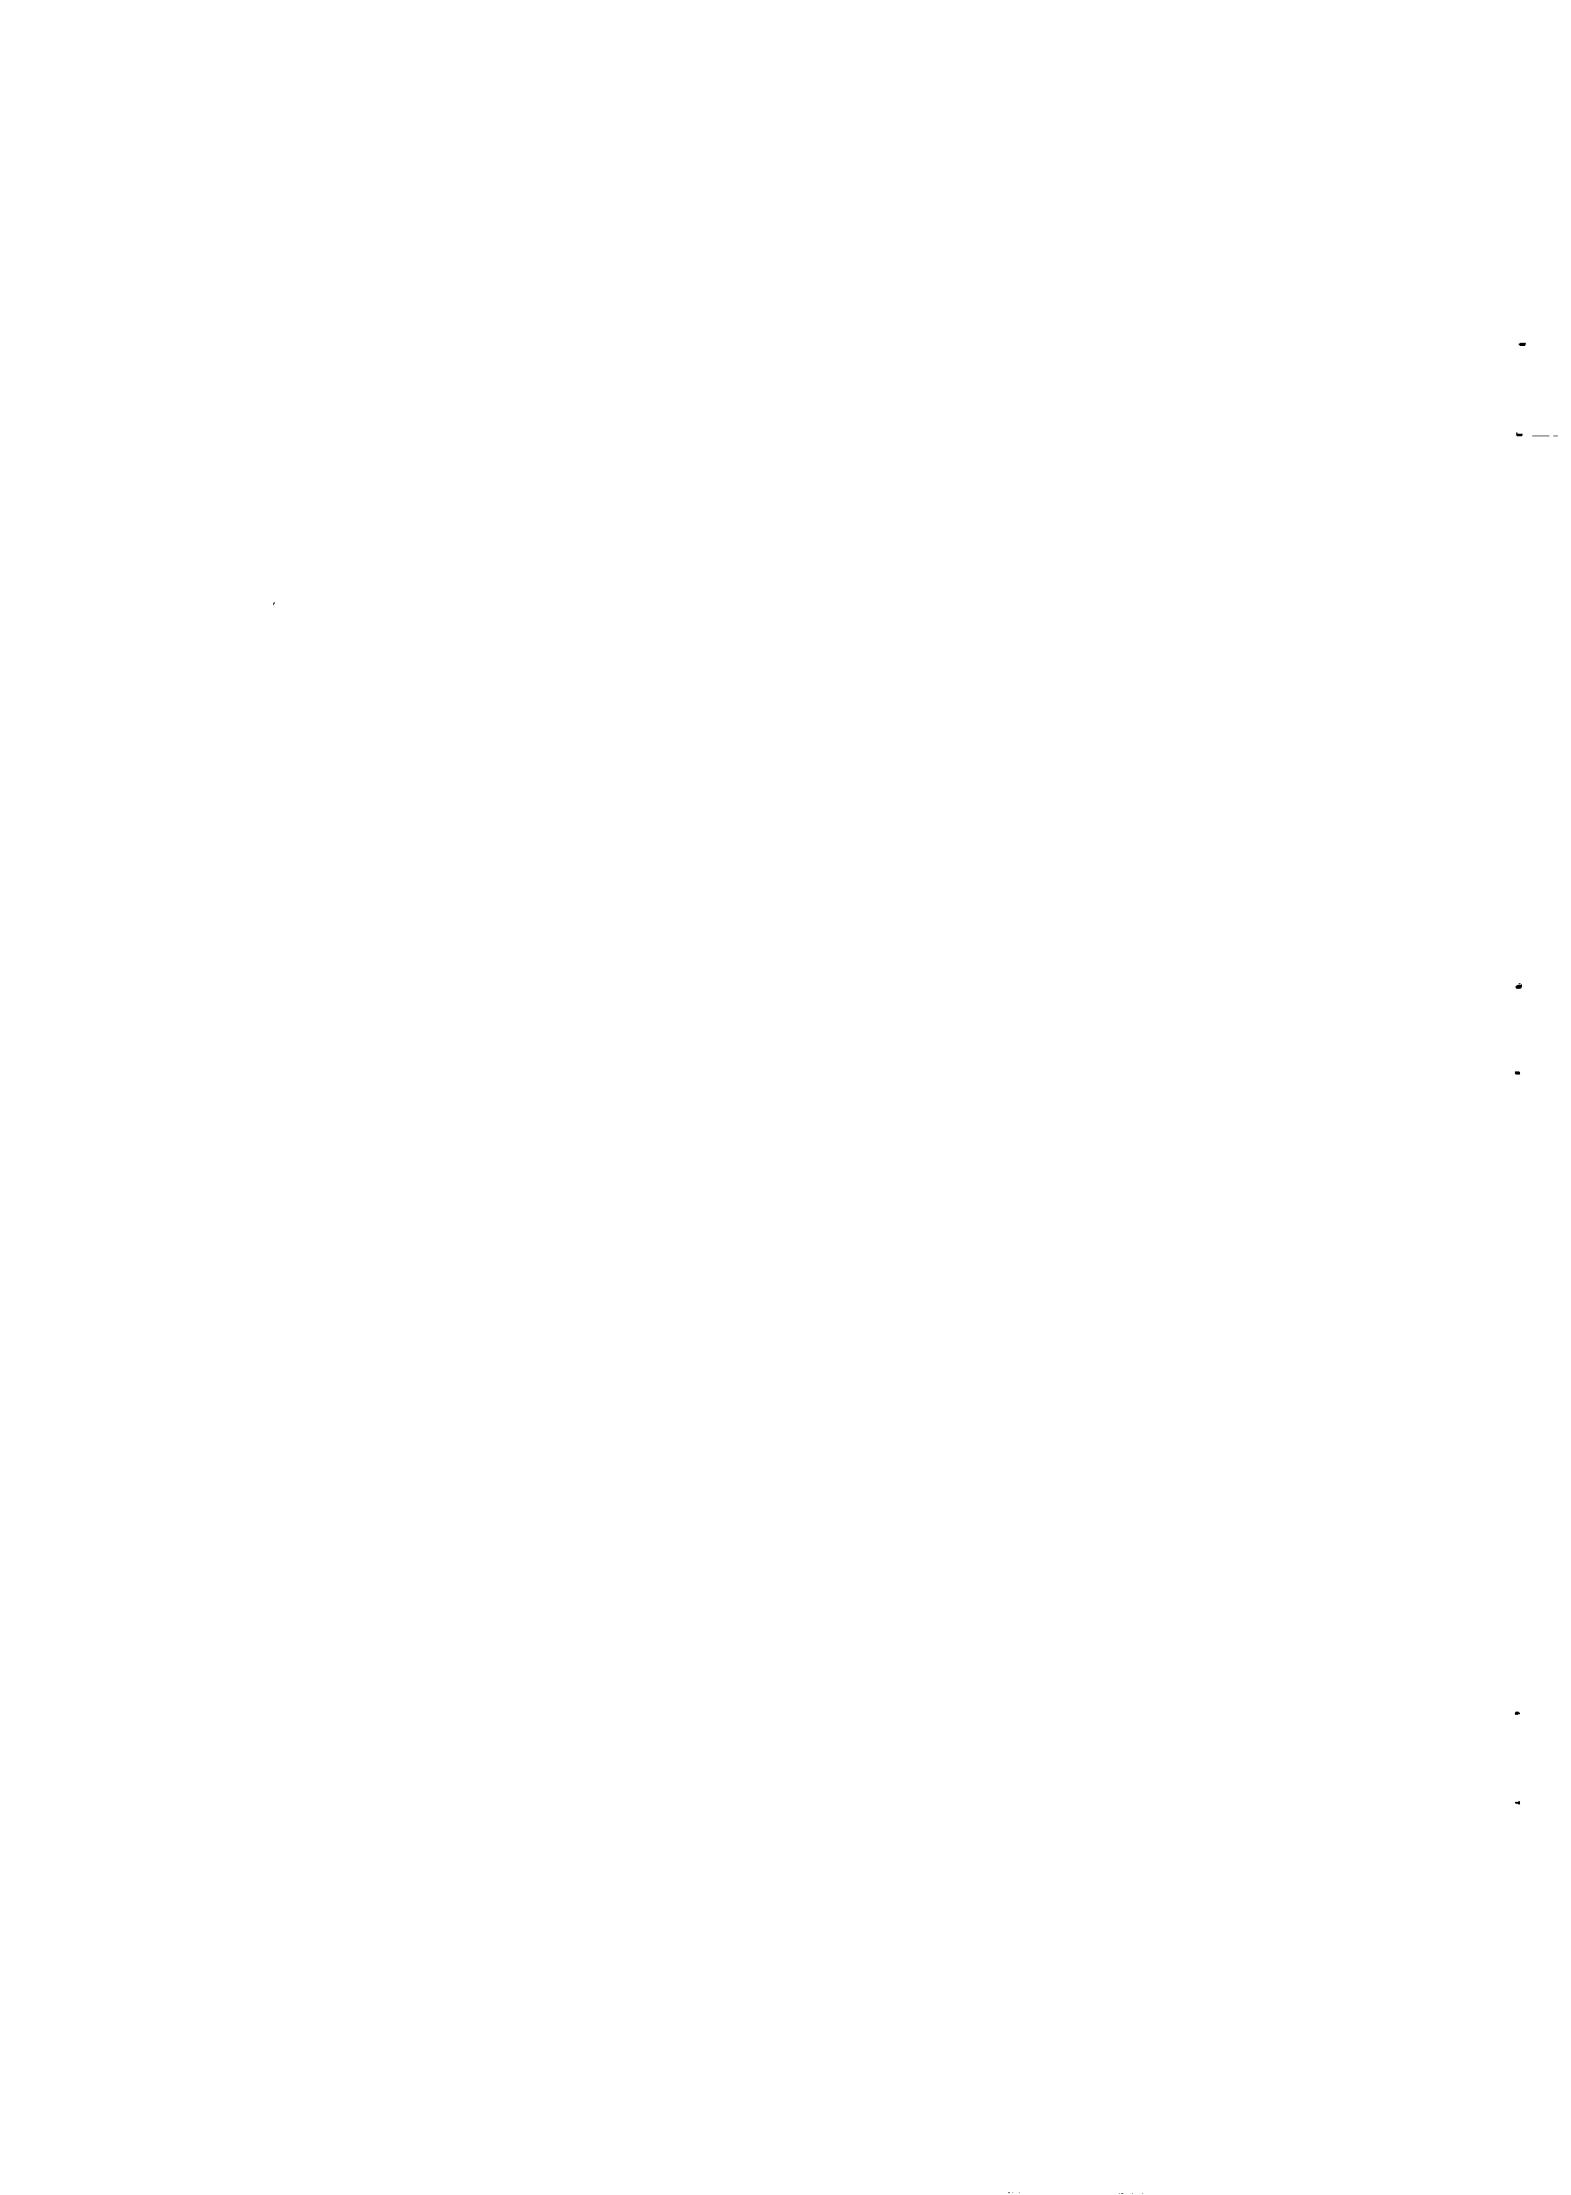

- A comparison of the past and present preferences among poor families indicates that the preference for homemade latrines has declined from 37% to 22% and for waterseal latrines preference has increased from 34% to 72%. The desire to defecate in the open has decreased from 29% to a mere 6%.

Problems encountered

- The user families had indicated that 37% of the superstructures and 31% of the sub-structures were not durable.

(j) Disposal of Children Faeces

- Table IX shows that only 103 latrines were used by at least one child (below 10 years of age) of a family.
- In almost all the cases the children faeces were disposed of in ditches/open places.

Water for latrine Usage

- The sources of water for use in latrines were tubewells, ponds and others like canals/river etc in 56%, 28% and 16% of the cases respectively.
- In 46% of the cases the distance of the water source from the latrine was 50 ft. or less and in 54% of the cases more than 50 ft.

(k) Latrine Habits of family members

- Table X shows that among the families surveyed the latrine users were 581 females, 612 males, and 162 children (below 10 years of age) as against totals of 595, 680 and 517 respectively.
- Some 13 latrines were exclusively used by only female members and 59 (25%) of the latrines were used by all members of the families.
- No latrine was exclusively used by male members.
- All the latrines were used by at least one member of the family.

(l) General Observations on Latrines

- Table XI indicates that the superstructures of 54 latrines were attractive and 105 were not attractive.
- Some 76 platforms were well cleaned and 85 platforms were not acceptably cleaned.
- Some 73 pits were intact and 61 pits were found partially damaged.

Table XII reveals that a total of 158 villages were visited by the surveyors. Homemade pit latrines were found in only 79 of the villages (50%) surveyed.

6.0 CONCLUSIONS

Based on the findings the following conclusions may be drawn:

- (i) It is interesting to note that home-made latrines were used by a wide spectrum of families irrespective of varied occupations, literacy and income levels.
- (ii) Privacy and then health are the two primary reasons given by villagers who were using homemade latrines. However, in half of the villages visited no homemade latrines could be found. A great deal of promotional work is required.
- (iii) It would appear that the habit to use latrines takes at least 2 years to develop.
- (iv) The use of digested sludge from pit latrines in agricultural purposes is extremely low.
- (v) There appears to be a willingness to use an improved sanitation technology (water seal latrines) in the future.
- (vi) Some latrines were exclusively used by female members of some families making it necessary to construct at least two latrines in such cases.
- (vii) The use made of offset pit latrines which are safer for children was unfortunately relatively low. The use of offset pit latrines needs to be promoted.
- (viii) A large proportion of the latrines were not being used by children.

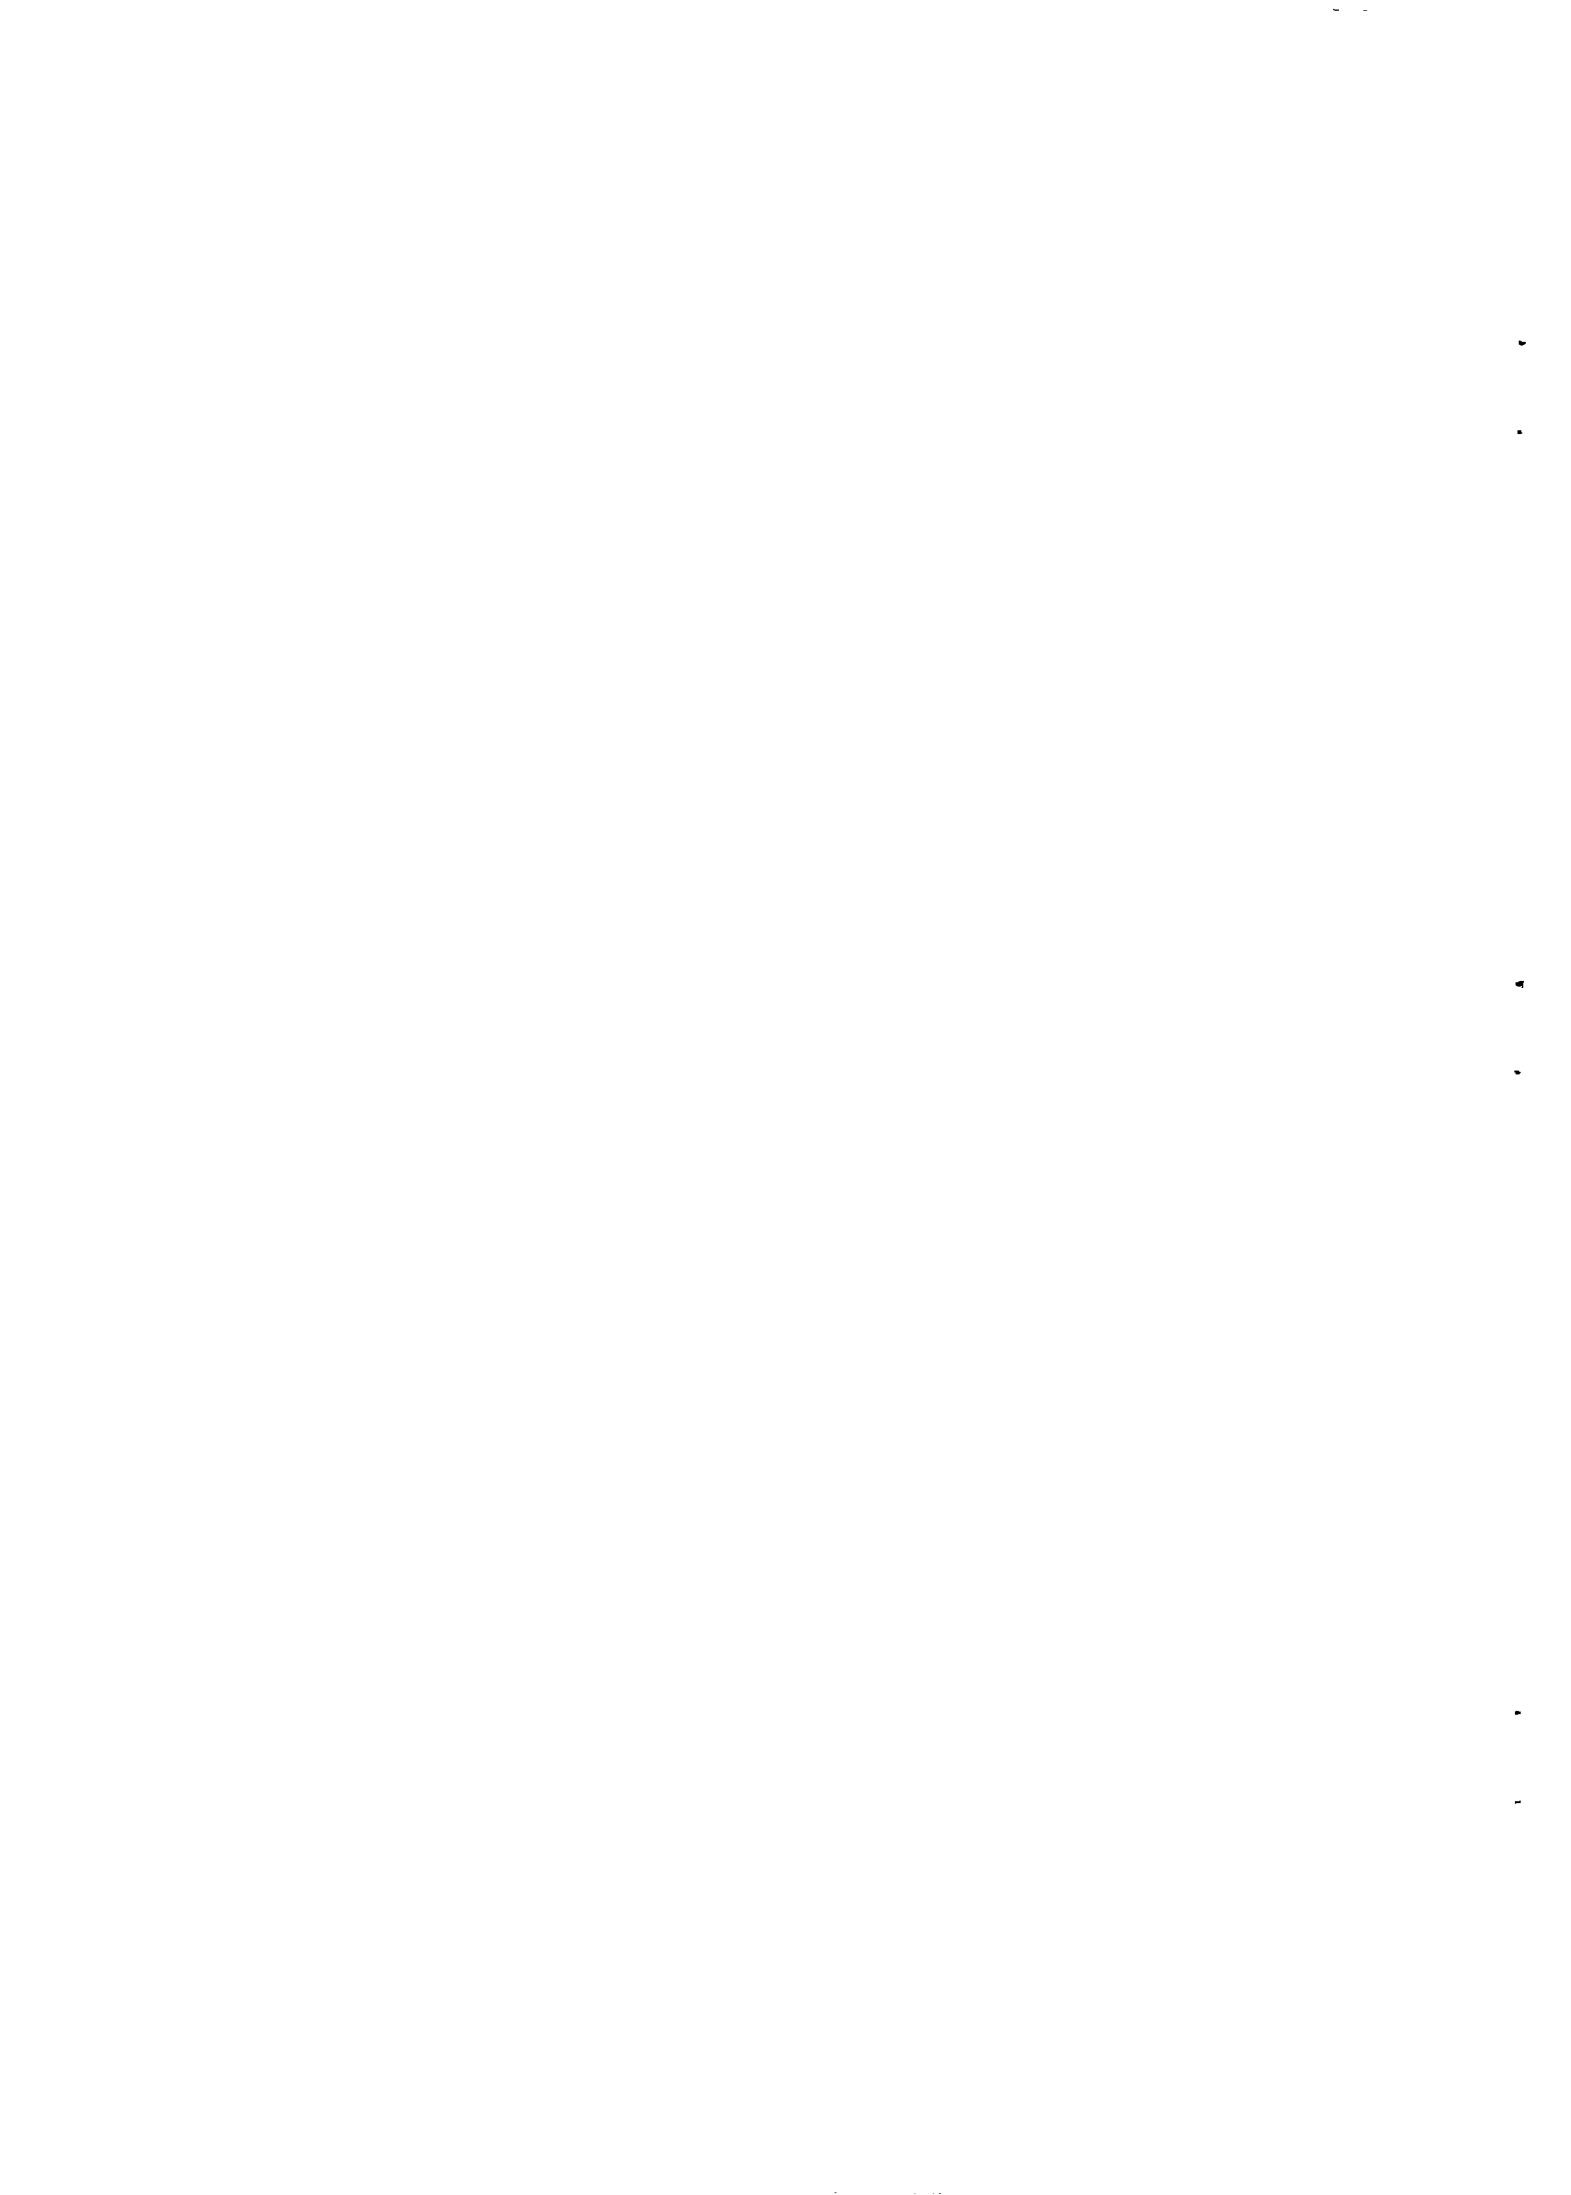

- (ix) The faeces of children not using latrines was disposed of indiscriminately in open places.
- (x) A large percentage of latrines surveyed had no roof making it difficult to use such latrines in the rainy season.
- (xi) It appears that villagers are prepared to spend upto Tk. 110 for a direct pit homemade latrine and up to Tk. 125 for an offset pit homemade latrines.
- (xii) Some of the latrines were located within a distance of 30 ft. from water supply sources posing a potential water contamination hazard.

8.0 Recommendations

Based on the preceding findings and conclusions the following recommendations have been drawn:

- (i) Well designed homemade latrines should be promoted where precast/prefabricated latrine components are not available.
- (ii) User friendly, self-instructional manuals or leaflets should be prepared and distributed to villagers to provide practical guidance for the construction of homemade latrines.
- (iii) The social mobilization approach should be adopted. Schools/ Mosques/ Madrasa/ Leaders/Service Clubs/Extension workers/NGOs etc should be involved in this effort.
- (iv) Based on the findings, it is recommended that the cost of homemade pit latrines to be promoted should not exceed Tk. 125.

- (v) Precast/prefabricated latrine elements (pour-flush slabs) should be readily available to those interested in improved sanitation.
- (vi) The following hygiene messages should be disseminated:
 - Excreta is a source of pathogens
 - Good sanitation practices protect health
 - Excreta should not be exposed to flies, arthropods, poultry etc. Arrest excreta in a pit or cover with soil or ash.
 - Children faeces are equally dangerous as that of adults.
 - All family members - female, male and children should use latrines.
- (vii) After resting undisturbed for 2 years in a pit, sludge should be removed from pits and used in agriculture as manure and soil conditioner.
- (viii) Latrines (including roof) should be built in such a way that they are useable at all times (irrespective of seasons, time of the day and inclement weather conditions).
- (ix) Latrine pits should be located at least 30 feet away from water sources.
- (x) Consideration should be given to provide separate latrines for females and males to observe cultural norms.
- (xi) For the convenience and safety of children, offset pit latrines should be promoted.

(xii) Based on the findings the following criteria for the design and construction of homemade pit latrines is recommended:

- Size of the cubicle, 4.5 ft.x 4.5 ft.
- Thatched roof;
- Fence may be of jute stick, tarja/bamboo, leaves or straw.
- For doors jute mats are preferred. Straw, leaves and jute-sticks may also be used.
- The fence and roof (if installed) could be supported on 4 bamboo poles.
- The height of the plinth should be 6 inches.
- The size of the platform should be about 4 ft.x 4 ft. utilizing bamboo or wood.
- The platform for an offset pit latrine should be constructed of either concrete or brick and the length of iron sheet/plastic chute should be about 2 ft.
- The size of the squatting hole should be about 15 inches x 8 inches.
- A squatting hole - cover with a handle should be provided
- The diameter of the pit should be about 3 ft.
- The maximum depth of pits without lining in sandy, silty and clayey soils should be 5 ft., 6 ft. and 7 ft. respectively. Normally lining is not required; if needed, bamboo or branches of trees may be used.
- The shape of the pit may be cylindrical, conical or oval depending on soil type.

Mr Alex Redekopp
WHO Sanitary Engineer
DPHE, Dhaka

17 February 1993
RWS/407/165

Dear Mr Redekopp:

Subject: Study on Do-it-yourself (Homemade) Latrine

Further to the meeting on 21 January 1993 chaired by Mr A R Mridha, Project Director, Village Sanitation, DPHE with the participation of DPHE, WHO and UNICEF, kindly find enclosed a TOR for the above study. We hope that the proforma for the study will be initially developed by WHO, and finalized with inputs from DPHE and UNICEF, as necessary. Sample sizes and number of clusters have been suggested in the TOR. However, you may look into this and propose amendments in the next meeting with DPHE and us.

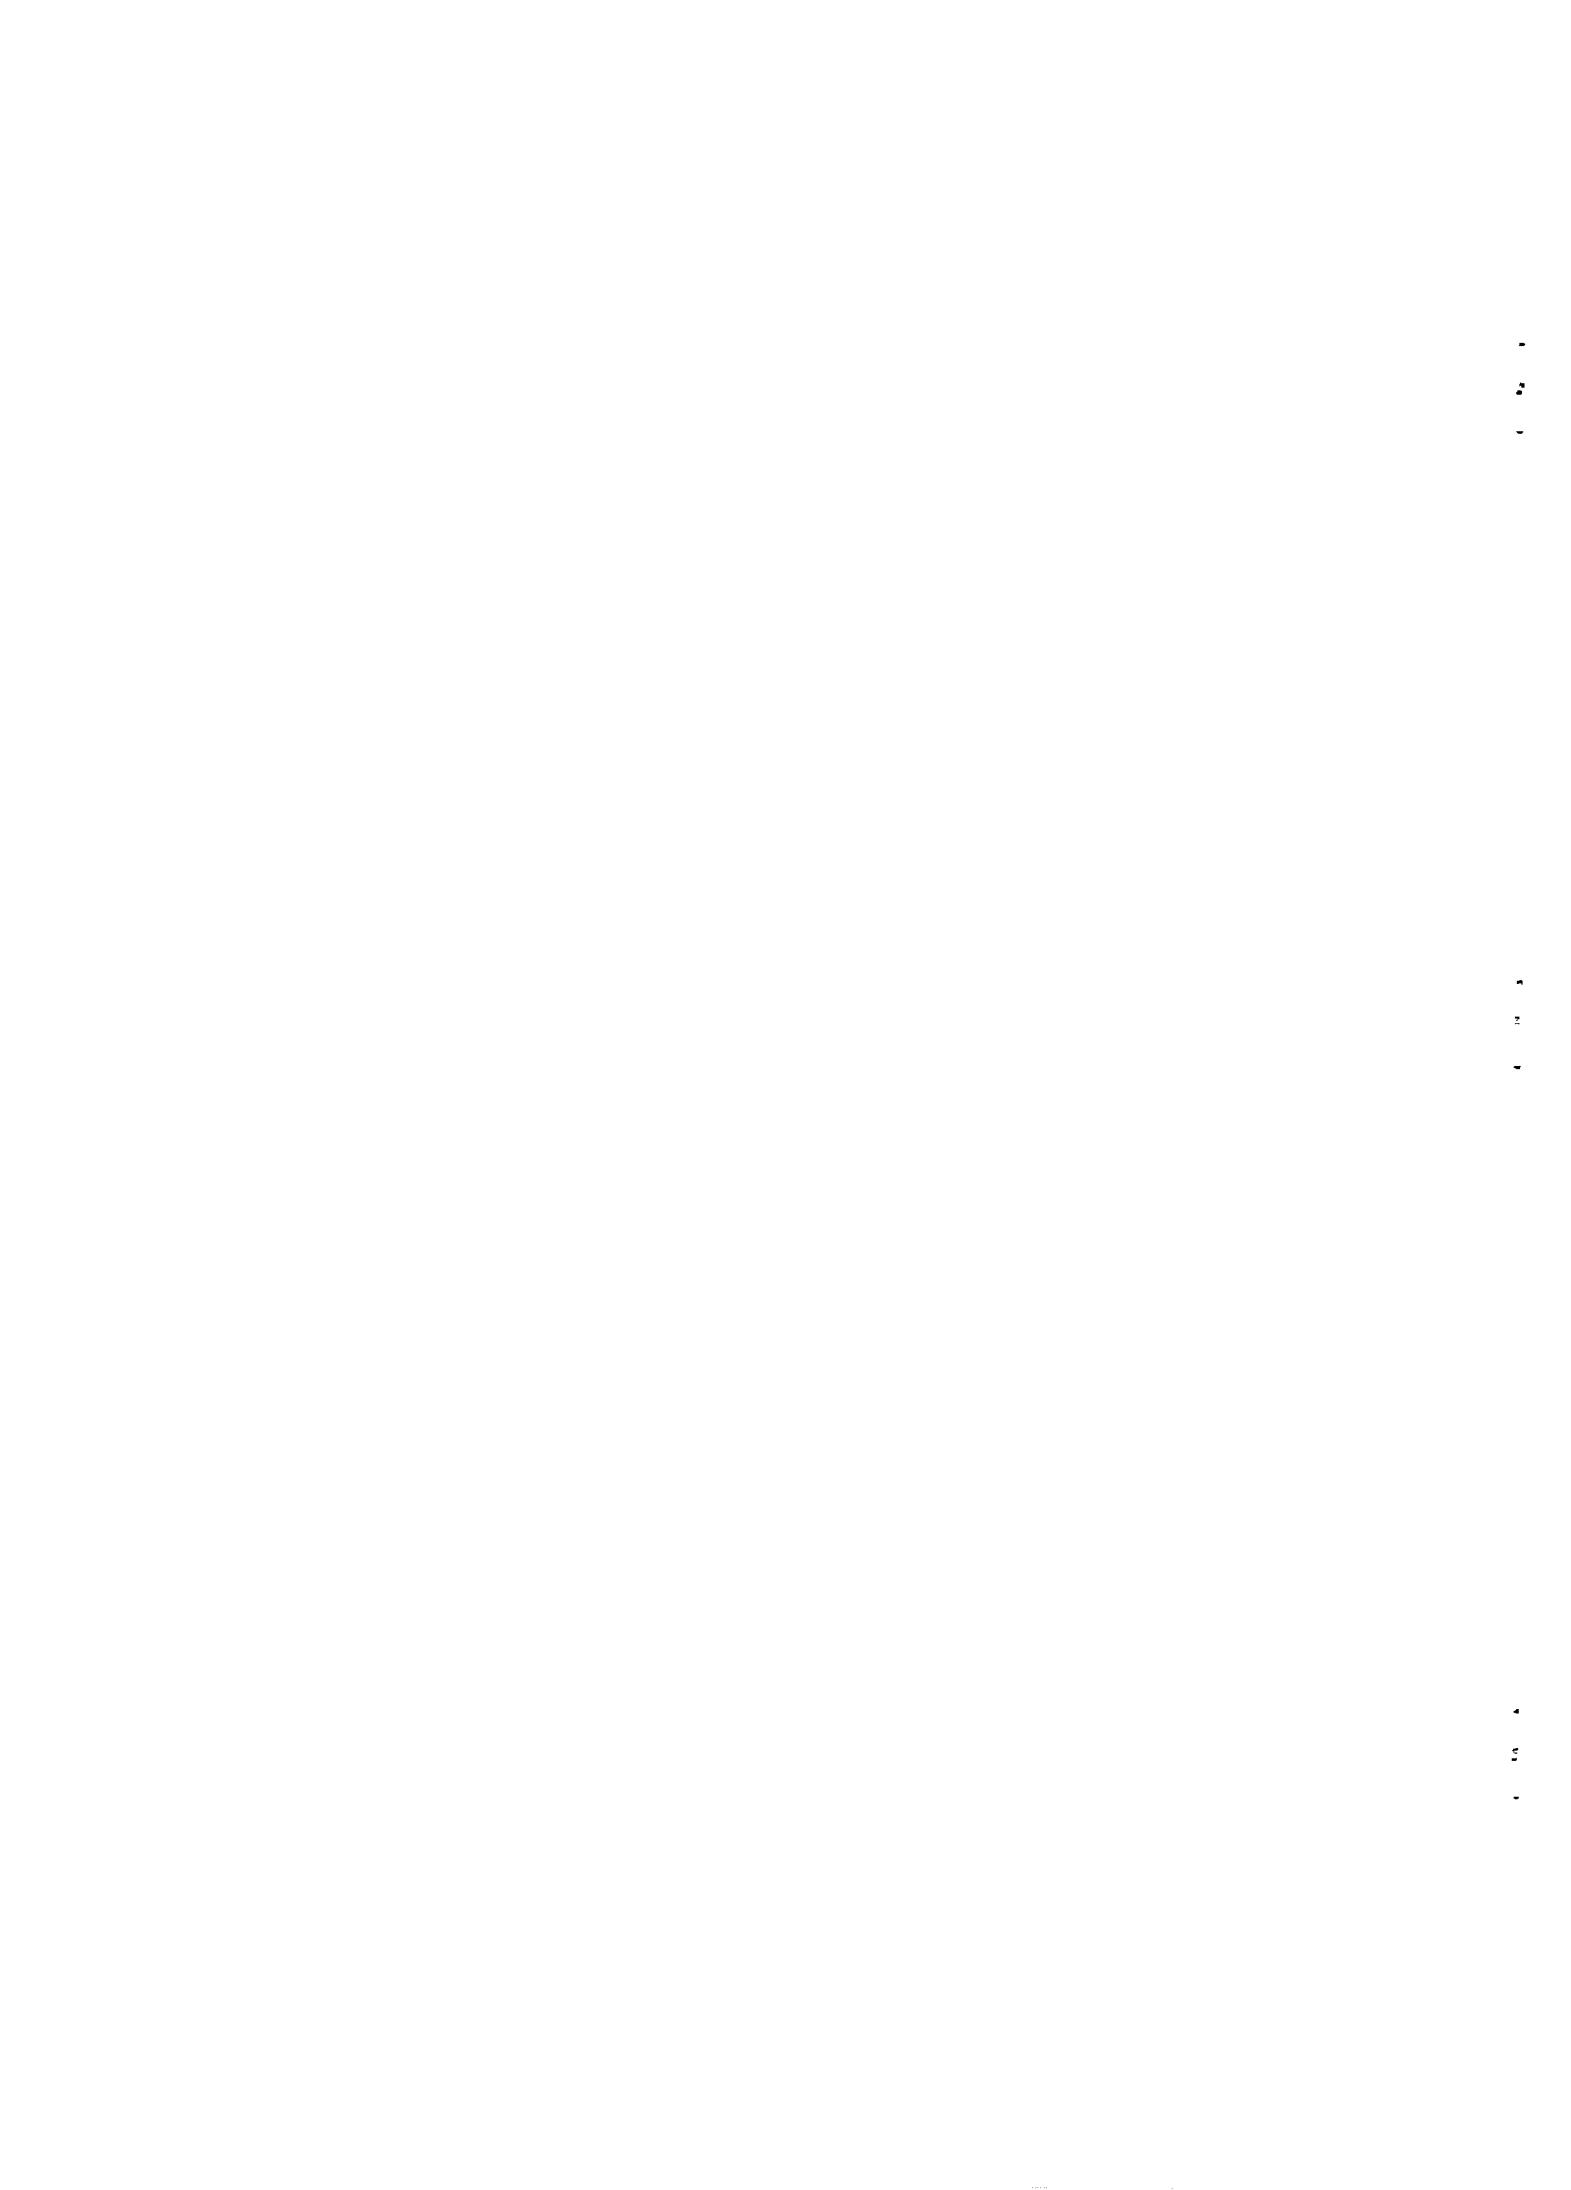

With best regards,

Yours sincerely,

P. Wan
Chief, WES Section

Terms of Reference for study on do-it-yourself (Homemade) Latrine

Background

In Bangladesh approximately 260,000 children under five years of age, die of diarrhoeal diseases every year. The causes are predominantly due to limited use of tubewell water for all domestic needs, poor environmental sanitation and personal hygiene practices.

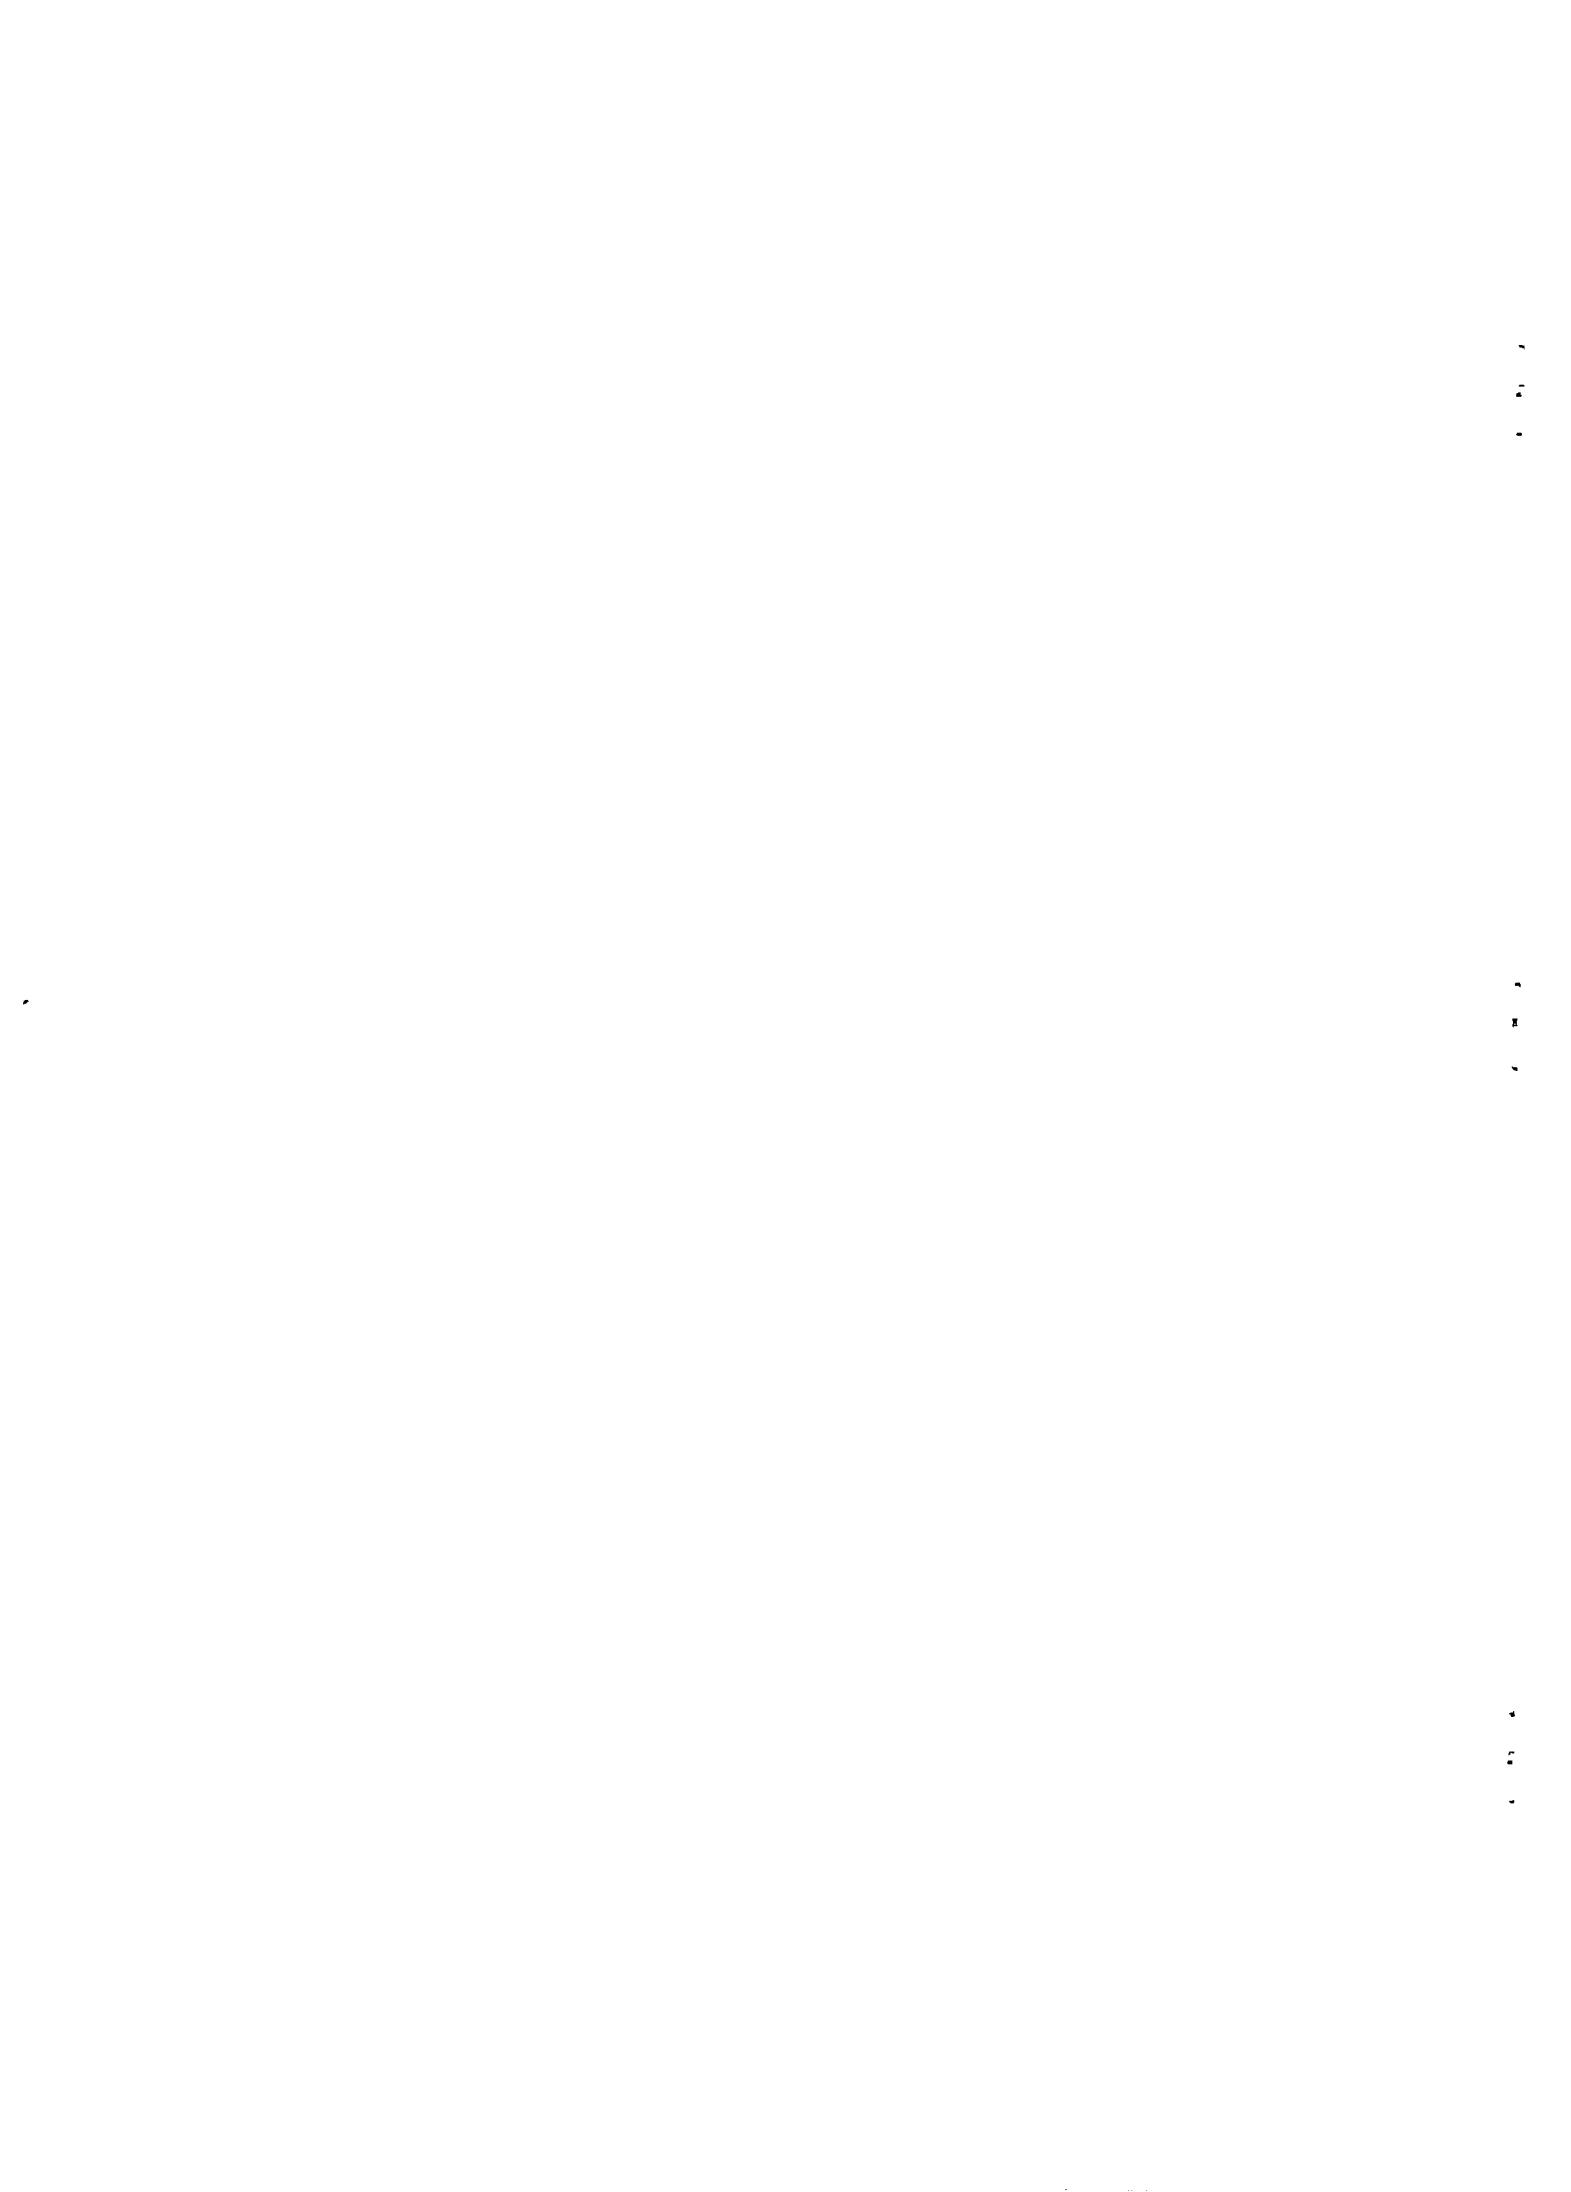

A recent survey by Mitra Associates in 1991 indicated that the sanitation coverage was 26% of which 60% of the latrines were homemade latrines and 10% were of the water seal type. Since 1987 through EA programme, homemade pit latrines were promoted for families who could not afford to buy, the water seal latrines. In order to assess the status of the homemade latrines in terms of the technology and users reaction, it is proposed that a study be undertaken.

Objectives of study

Homemade latrine (do-it-yourself latrine)

The study will include the following:

1. Type and dimensions of the pit latrine.
2. Soil conditions.
3. The type of material used for pit lining, squatting platform, pit covers, and superstructures.
4. Cost of materials and labour.
5. Users' attitude towards pit latrine.
6. Source from where construction technique was learnt?
7. Life of latrine pits.
8. Economic status of the families, usage level, category-wise (male, female, children) and number of users.
9. Steps taken when the pit is filled up.
10. Any effect in due to weather condition.

Methodology

The study will be undertaken by using pre-tested questionnaires and interviewing a sample of users.

The study can be done in 2 unions in each of the 7 circles of DPHE. Data will be collected from 10 users in each village of the 35 Unions.

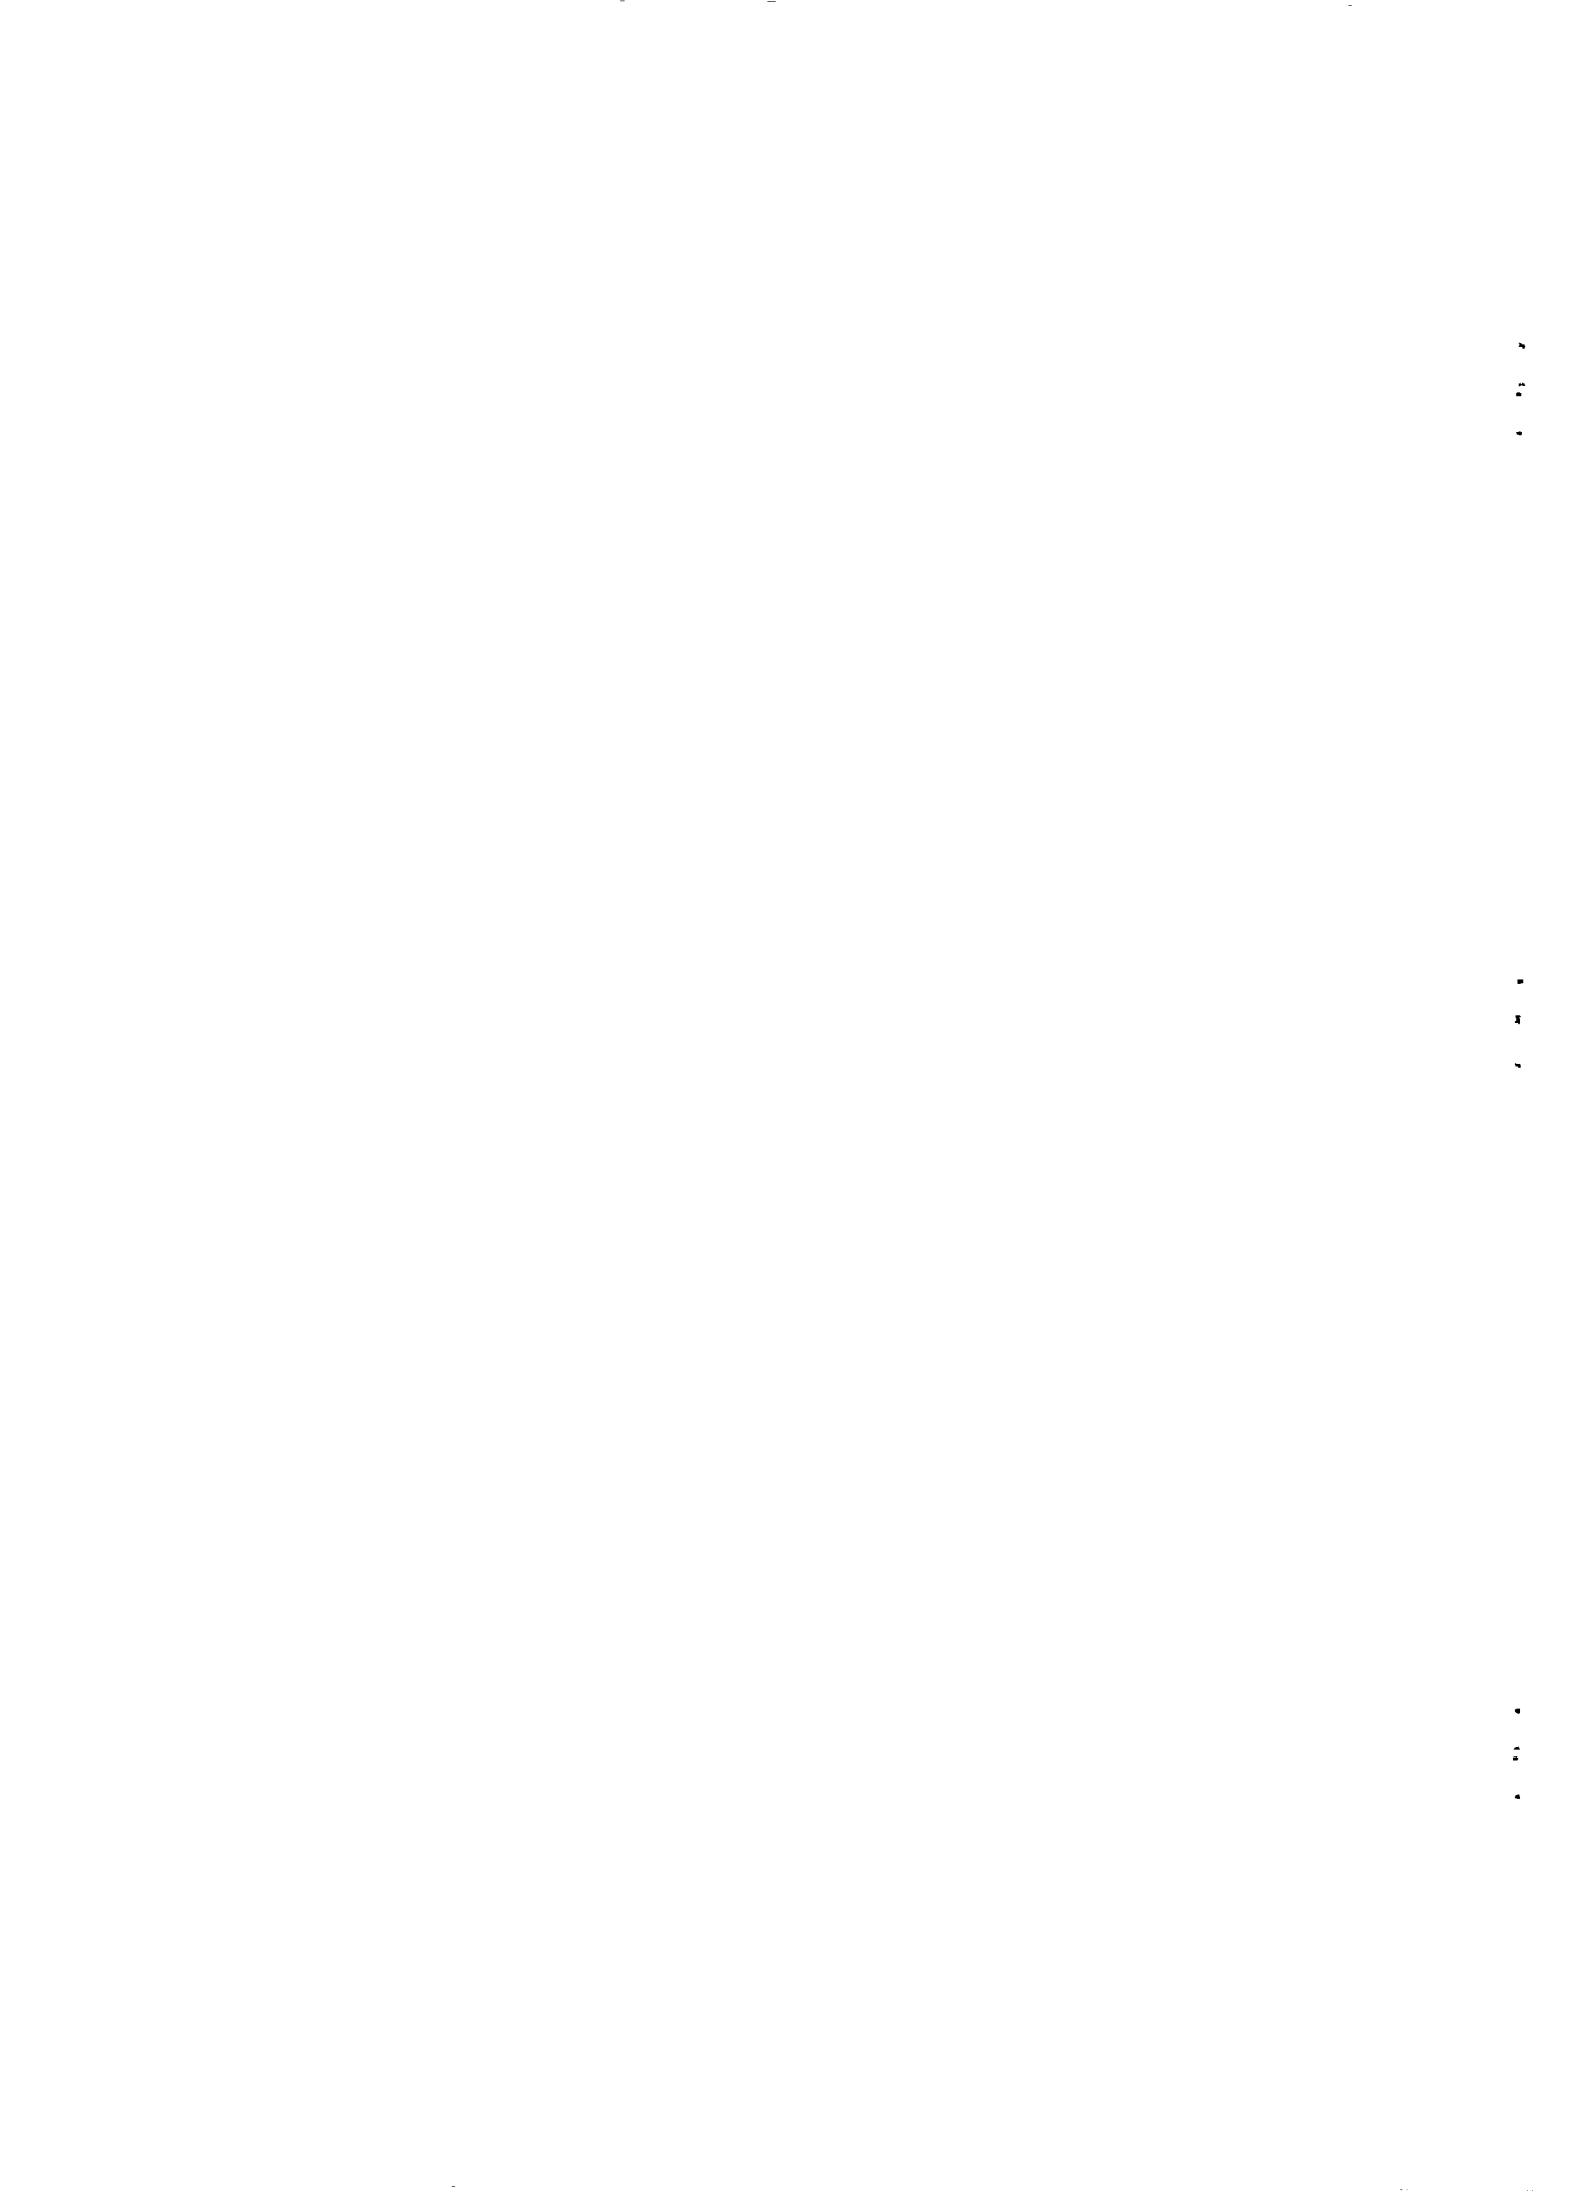

Time Period

The study shall be completed in 4 - 6 weeks.

Study Proposal

The study will be done by WHO FSOs. Questionnaire will be finalized in consultation with DPHE and UNICEF.
