## EXECUTIVE SUMMARY

### PROJECT

The Department of Public Health Engineering(DPHE) is responsible for supplying potable water to the rural people of Bangladesh. United Nations Children's Fund(UNICEF) has been assisting DPHE in its endeavor since 1972. Since 1970's and particularly after 1980's the growth of minor irrigation was rapid. Due to large scale abstraction of groundwater for irrigation use, the groundwater levels have lowered in many areas rendering many tubewells fitted with suction mode hand pumps inoperable particularly during dry months. To sustain the continued water supply to the rural people installation of Tara (deepset) pumps are required.

The Engineering and Planning Consultants Ltd. in association with M/s. Mott MacDonald have been assigned by DPHE/UNICEF to identify the areas for phasewise requirement and installation of Tara pumps. The work started from 20th December, 1993 and ended on 20th June, 1994.

The areas under study covered all of Bangladesh excepting the coastal areas, greater Chittagong, Chittagong Hill Tracts and part of greater Sylhet district. The main reason for exclusion of these areas is inadequate database. The total number of studied thanas are 349 and listed in Table 1.2.

A wide range of models and programs were used, and developed as required to form an integrated package for predicting the impact of irrigated development on rural water supplies. According to the local hydrogeological conditions, these models can be equated with single or multiple layered aquifer conditions as applicable according to the aquifer conditions. All the areas are modelled as single cell models, where the basic grid cell is equivalent to a thana. Both the single and multiple layer aquifer conditions are modelled through the integration of a suite of new and existing models and data sets. The elements of the modelling approaches are :

- Definition of potential recharge as the ultimate limit to groundwater development
- Definition of depth-storage profiles to determine the relationship between the net groundwater abstraction and depth to water
- Analysis of historical minor irrigation data to predict future growth of irrigation by mode

- Compilation and analysis of historical irrigation statistics and demographic data in order to estimate groundwater abstraction
- Compilation of groundwater level data to define the existing conditions for hand pump tubewell operation
- Calibration of depth-storage curves against historical water level and abstraction data
- Prediction of future water levels

For single layer aquifer conditions, the following steps have been defined for prediction of future water levels (and are further illustrated by Figures 1.1 to 1.3).

In total 349 thanas of Bangladesh were studied and the thanawise final output of the model results are given as Data Report in four volumes. A sample of the output of Adamdighi thana is given in Figure 1.4.

The final calibration of Adamdighi thana in Bogra district is given as a case study. Hydrographs and model output for Adamdighi are shown in Figure 1.5 to 1.9.

Figure 1.7 shows the basic depth-storage calibration. The water level and abstraction cross-plot is calibrated with the medium depth-storage plot. No increase or decrease of the specific yield values were required. The abstraction in 1991 exceeded the Master Plan Organisation's (MPO) estimated usable recharge but according to figures 1.5 and 1.6 the recharge capacity of the aquifer has not been exceeded and justifies a modest increase in the usable recharge factor of 20 percent. Figure 1.8 shows the rapid growth of irrigation since irrigation shallow tubewells became easily available and that there is infact, little irrigable land left for further development. Based on this rate of growth the figure 1.9 shows the net abstraction and the resultant water levels would be expected in 1995, and it will remain static till full development. Please note that in cases where irrigation growth stops in the near future due to exhaustion of recharge, subsequently the irrigated areas will decrease due to increase in demand of drinking water supply for increased population.

The study results predicted the hand pump tubewells requirement for the years 1995, 2000, 2010 and in full development of the resources and is given in Table 1.2.

Hydrogeological parameters and use of land and water resources were worked out and are shown in Table 1.3.

## **CONCLUSION AND RECOMMENDATION**

- a) UNICEF may prepare a schedule for phased replacement of No. 6 pumps by Tara pumps in the predicted areas as "Marginal Tara areas" and "Tara areas" as shown in Table 1.2. A summary in tabular form indicated the phased coverage of thanas by hand tubewell requirements is shown in Table 1.1 and another summary predicting the population to be served by the different hand pump system is shown in Table 1.1A.
- b) In order to improve the studies more accurate monitoring of groundwater development will be needed in terms of nationwide network of groundwater levels, numbers of operating units and actual abstraction.
- c) The studies have indicated that groundwater development may be constrained in areas of the eastern hills of Sylhet and the Sylhet basin due to difficult aquifer conditions and use of LLP for surface water availability.
- d) Uncertainty over the privatization of DTWs specially in time. With the increase of population the irrigation demand may be higher and to meet up the demand the privatization of DTW will come up.
- e) In the study the deep percolation (DP) values of the MPO DP3 (medium value) is used. In some cases the abstraction is far below the DP3 condition but in areas like Bogra district for higher abstraction, DP4 (medium high) values were considered. So, care should be taken to use the DP values.
- f) Groundwater recharge conditions in Bangladesh is advantageous with rainfall and with much of the country flooded during the monsoon.
- g) In the terms of reference there is no provision for hardware or software handover, training or production support. Some training is always necessary and there may be some provision for pertaining training to the users. Moreover, we believe the programs which we have developed for this project have an application in DPHE and UNICEF that go beyond the specific objectives of this project.

**TABLE 1.1**  
**Summary of Hand Tubewell Requirements**

Hand Pump Technology	1995		2000		2010		Full Development	
	Nrs. of thana covered	%

### Predicting Water Levels in 1995 and 2000

**Figure 1.3**

## Predicting Water levels at Full Irrigation Development

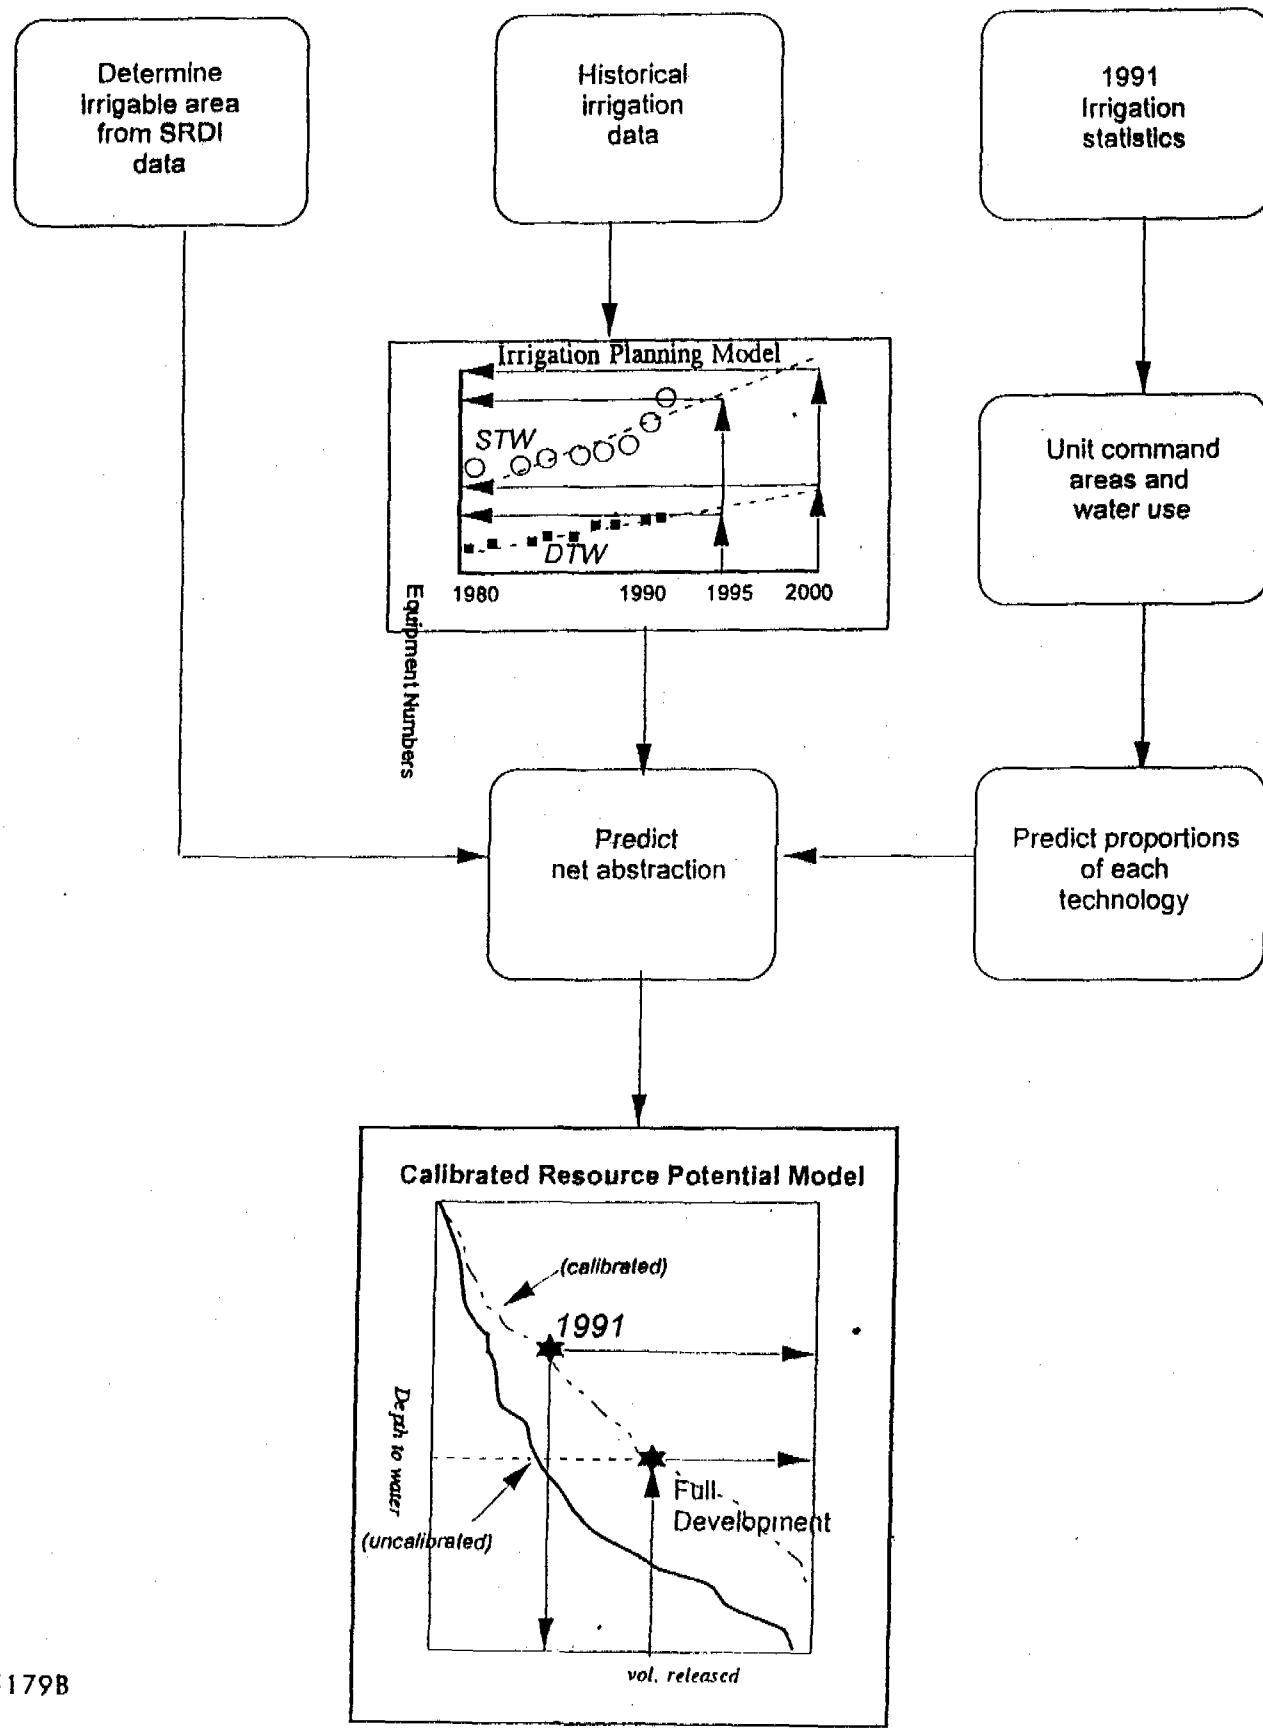

Figure 1.4

Geocode: 51006 Dist: Bogra

Thana: ADAMDIGHI

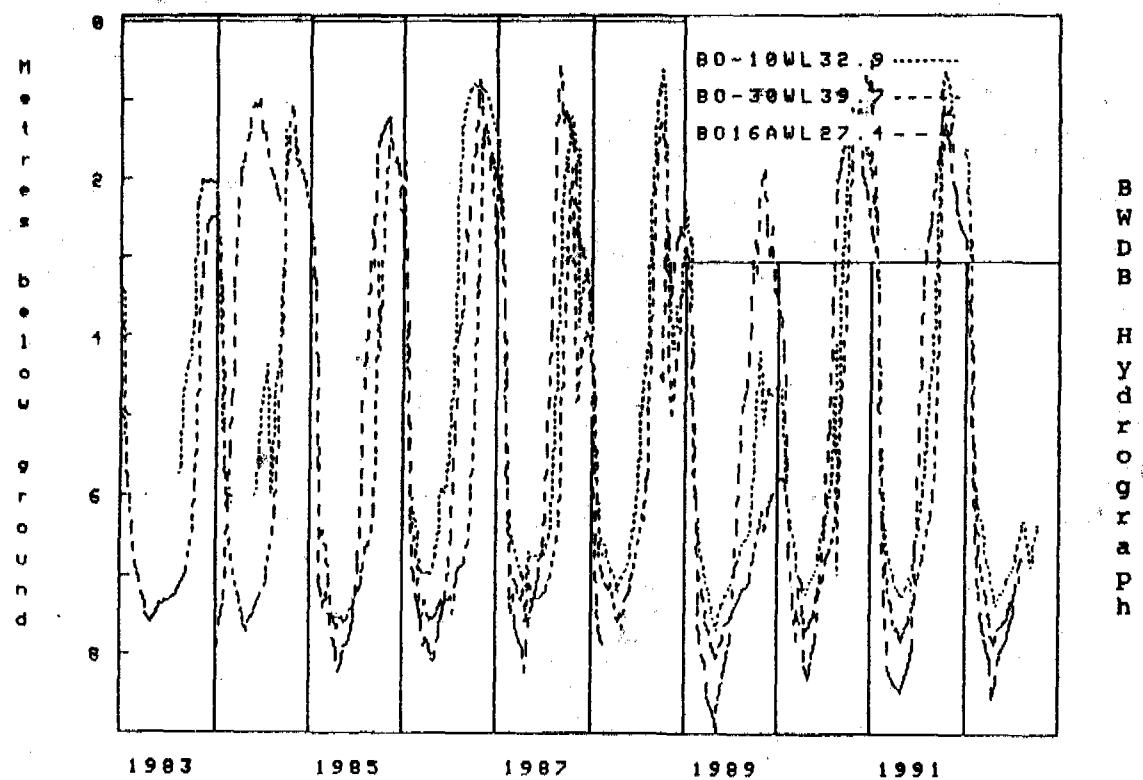

1 of 2

Gross area : 17,092ha Population(1981) : 132,690 Transmissivity : 2500m<sup>2</sup>/d  
 Irrigable area : 14,086ha Usable recharge : 327mm Surface clay : 9 m  
 FO: 65.2 F1: 8.5 Net irrigation reqt.: 440mm Aquifer type : SINGLE  
 F2: 17.9 F3: 0.0 Deep percolation : 2.5mm/d

Union	Popln. (1981)	Hand Pumps '92			Depth Water (m)
		Nr	6	Tara	Deep
Adamdighi	19,050	164	28	0	8.5
Champapur	17,245	148	28	0	8.8
Chatnigram	22,197	204	29	0	8.8
Kundagram	18,413	157	28	0	7.6
Nasratpur	18,961	164	28	0	8.5
Santahar	36,824	170	32	0	9.1

#### Minor Irrigation in 1993

Pump Type	Number Operating	Irrigated Area(ha)
STW	1,172	6,047
DSSTW	724	3,905
DTW	125	3,499
Manual TW	0	0
LLP	0	0
Tradi'n'l	1,350	717

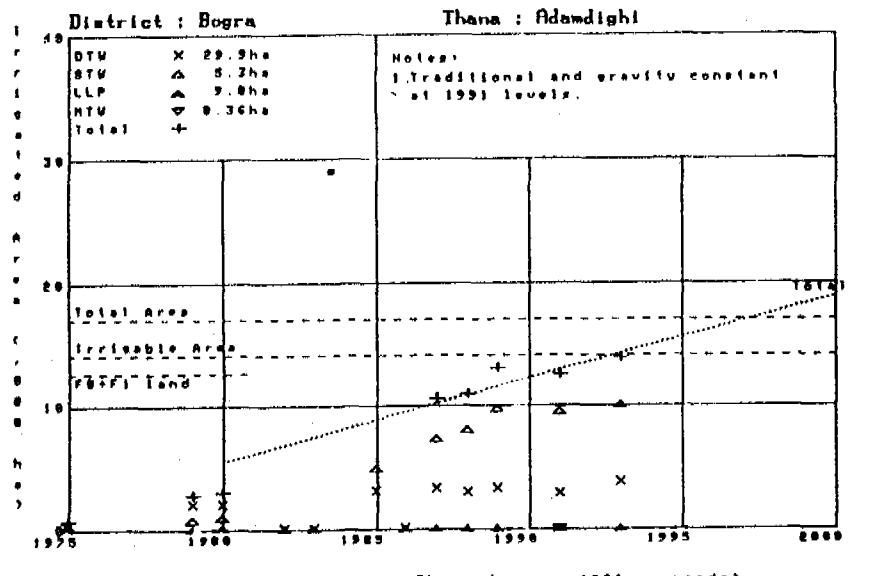

Average Depth to Water (m)

DFHE (deepest 1991): 8.9  
 BADC (deepest 1991): .  
 BWDB (deepest 1992): 8.8

Design Depth to Water (m)

Present maximum : 9.0  
 For calibration(1991)

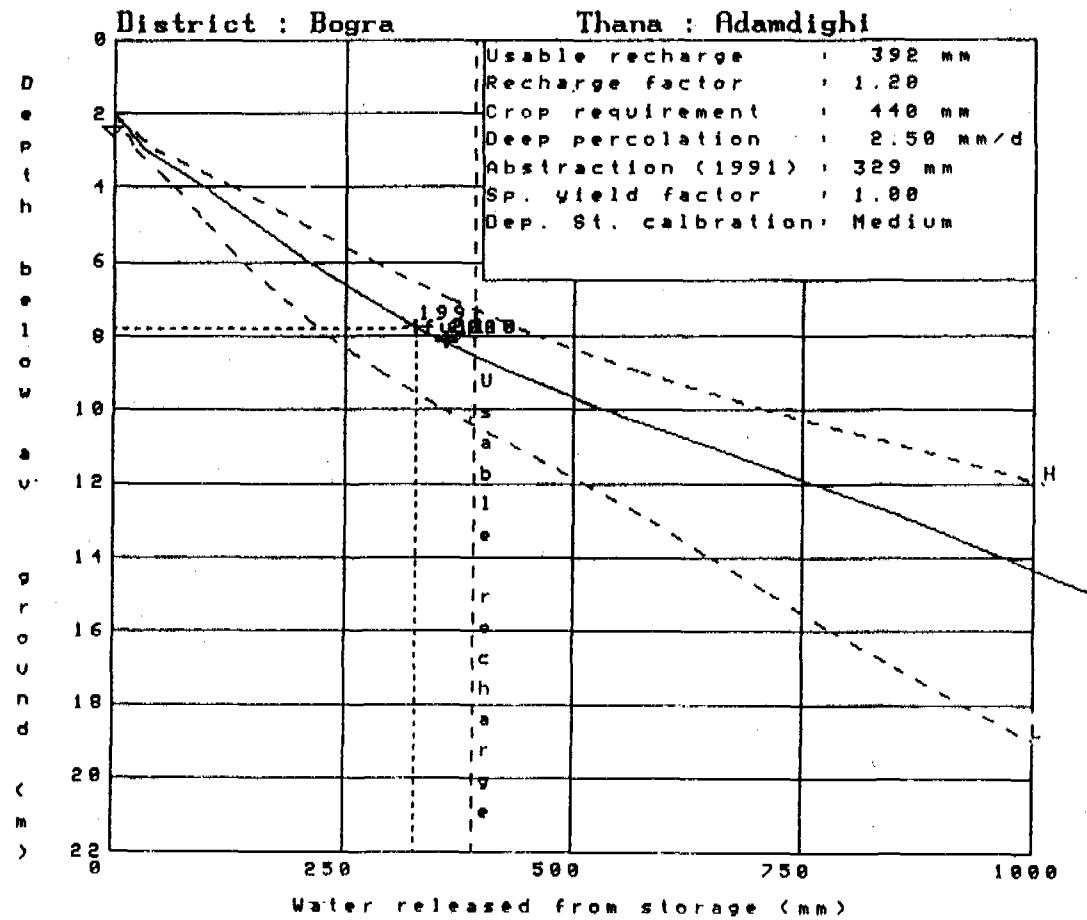

Early dry season: 2.5  
 Late dry season : 7.8

(Areas synthesised from Thana average 1991 commands)

**FUTURE REQUIREMENTS FOR HAND PUMP TECHNOLOGIES**

Year	Depth to Water (m)	Net GW Abst. (mm)	Recommended Hand Pump Technology
Present	9.0	329	Tara
1995	8.2	363	Tara
2000	8.2	363	Tara
2010	8.2	364	Tara
Full development	8.2	363	Tara
