WEEP: Water-security in Ethiopia and the Emotional-response of Pastoralists

Dr Paul Hutchings – WASH Futures 2018

<u>@pt_hutch</u> / p.t.hutchings@cranfield.ac.uk

Introducing WEEP

ESRC-DFID Development Frontiers Fund (2017-2019)

- Exploratory research, new thinking, results that challenge the status quo, uncertain success
- Cranfield University, IRC Ethiopia, Oxfam in Ethiopia, International Management Institute

"The underlying hypothesis is that **conventional ways of measuring water access poorly align with pastoralist livelihood patterns and water use.** This not only leads
to misleading data but also contributes to public policy and development interventions
that **damage pastoralists' resilience to overcome the stresses of poverty, environmental change and conflict."**

Can we do better than this?

Short comings of conventional water access indicators for pastoralists:

- the distinction they make between domestic and productive water does not correspond with pastoralists' *multiple-uses of water*;
- the emphasis on measuring service quality from single-water points does not capture pastoralists' customary approach of sharing numerous water sources;
- the household-level unit of analysis can mask inequalities between household members, which will be particularly pronounced when members of pastoralist households spend long periods away from the homestead (and which also prevents important analysis of intra-household differences across categories such as gender.)
- 4) Pastoralist resilience to conflict and environmental change has been linked with *mobility* this is not recognised in conventional ways of measuring water access

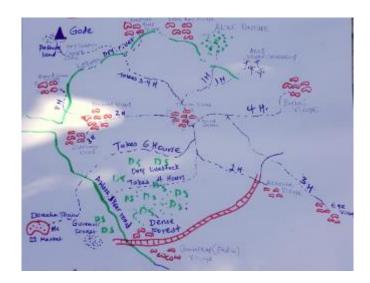

Alternative thinking

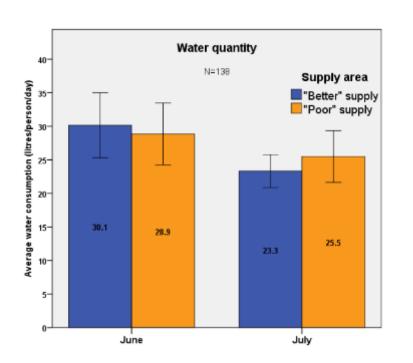

- Measuring pastoralist water use in practice is very complex
- A radical solution is to focus on a proxy measure instead – to measure something that is affected by water use
- Cross-cultural studies have shown that water security risks has detrimental impact on emotional wellbeing (e.g. Wutich and Ragsdale, 2008; Sultana, 2011; Stevenson et al., 2012; Jepson, 2014; Sahoo et al., 2015; Bisung and Elliot, 2017, White, 2017)

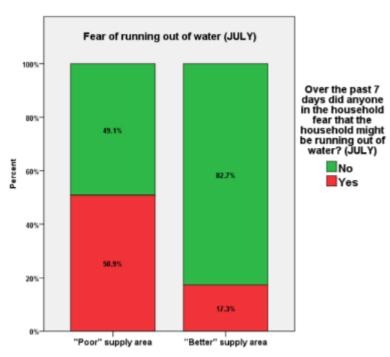

WEEP research agenda:

- Can we better understand the relationship between emotional wellbeing and water use in pastoralist communities?
- Could that relationship be the basis for a new form of experience-based water indicator for these populations?

Analytical power of a focus on emotional wellbeing

- Data from Welenchiti, Oromia, Ethiopia
- Compared the better and poor supply areas of a small town
- Household coping mechanism can bridge supply inequities
- Thomas et al. (2017), MSc Thesis

WEEP research overview

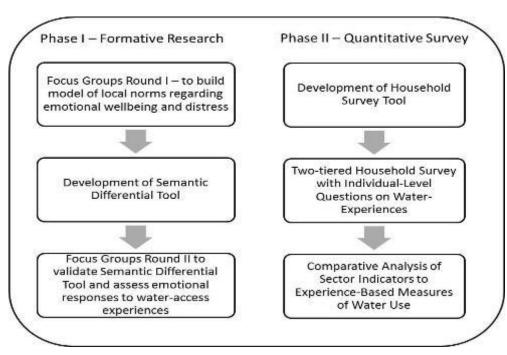

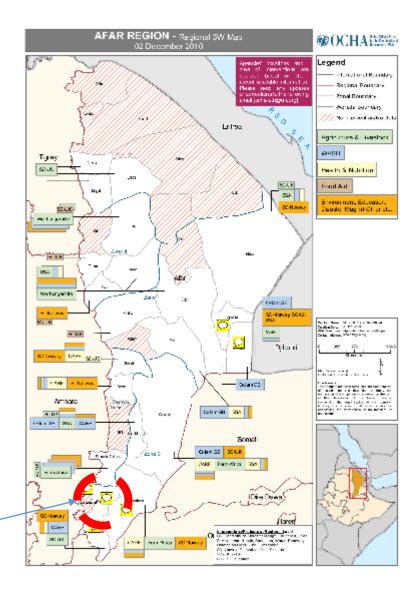

Figure 1 - Overview of Research Design

Study Sites: Afar State, Dulecha Woreda, Ege, Adkonta and Tirtira Villages

Formative Fieldwork Part 1 – initial findings

Resource Mapping Exercises

What are the things that can cause stress for a man/women in their community?

Ege		Adkonta		Tirtira	
Women	Men	Women	Men	Women	Men
Lack of water and pasture and the displacem ent this causes.	² Lack of water and pasture and the displacemen t this causes	Lack of water and pasture	¹ Absence from family due to drought and lack of pasture and water.	Lack of water and pasture, and the uncertainty and disappointm ent it causes.	³ Absence of pasture and water
	Absence of transport to health/mark ets	Absence of transport to health/mark ets	Absence of transport to health/mark ets	Displacemen t from home and lack of sleep.	³ Absence of transport
	Loss of wife - man takes on deceased's responsibiliti es	Forced to sell livestock but not enough for food (causes confusion and worry)	Unfair practices in livestock dealing and high overheads		
		Poor quality food	Sick/death of livestock in dry season.		
		Become sick so can't prepare food.	Expensive transport		

Formative Fieldwork Part 1 – initial findings

Resource Mapping Exercises

What are the things that make a man/women happy in this community?

Ege		Adkonta		Tirtira	
Women	Men	Women	Men	Women	Men
Rainy season – enough pasture and water – enough food and nutrition	Rainy season – enough pasture and water – enough food. Don't worry about where to take herd.	Rain season – enough food/milk	Reduced conflict – in dry season between Argoba and Essa communitie s	Grazing land available in the village Enough food	Rainy season – enough pasture and water – enough food. Brings good feelings
	¹ Social and Cultural events	Social and cultural events. Singing and dancing.	Enough water and pasture – healthy animals, good price.	More social, time to braid hair. 'Even older women look beautiful'	Have time to play and chat
			If they had enough services and infrastructur e	Social/Cultur al events – song/dance.	Alternative employment opportunitie s and crop cultivation.
			Able to buy fertiliser	We sit under tree and churn butter.	

Conceptual developments – validated and refined through formative fieldwork part 2

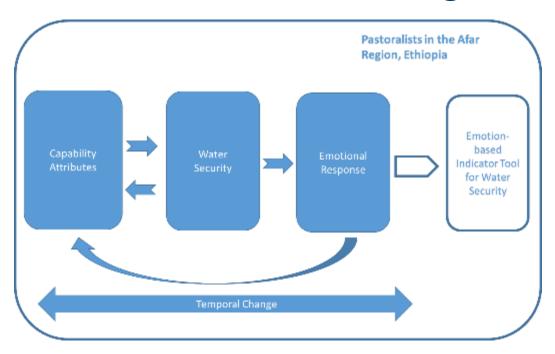

Figure Conceptual Framing for Water-Security in Ethiopia and the Emotional Response of Pastoralists (WEEP) (Adapted from Goldin, 2012)

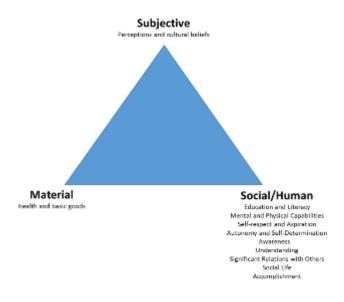

Figure: The three dimensions of wellbeing and capability attributes (Adapted from White, 2010 and Goldin, 2012)

Designing an indicator and applying in survey study

Considerations

- Based on conceptual framework
- Aggregation into composite indicator
- Nominal logic and quantification
- Validation of indicator
- Design and application of survey instrument
- Analysis against conventional indicators

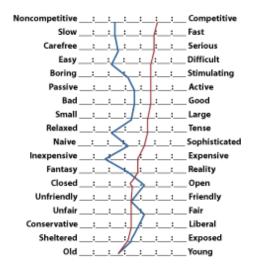

Figure 1 - Semantic differential

WEEP: Water-security in Ethiopia and the Emotional-response of Pastoralists

- New study into experiencebased indicators of water security
- A way to understand and evaluation the needs of vulnerable groups – M&E toolkits an output from project
- Detailed investigation into water within the Afari pastoralist context
- We are keen to learn from others' experience and share our learnings
